Another class of men whose services are not sufficiently appreciated are the compilers of books of reference. As every field and enclosure has to be numbered on the plans, similar numbers with the names of owners, lessees and occupiers of the property must be found in the reference-books. One supplements the other, and the lists must be no less exact than the plans. It is comparatively easy to prepare exact descriptions, but how are the conditions of tenure to be determined in a hurry? There are tenants who are ignorant of their landlords and suppose the agent is owner. There are holders of leases who are not aware of their degree of sub-tenancy. Sometimes incorrect information is wilfully given; sometimes it is inspired by stupidity alone. The reference-taker has to sift the evidence, to test it by rate books and parish documents, and to establish titles without any of the law's delay. If any one's interest is overlooked, the Examiner on Standing Orders is sure to hear of it, and a few cases are risky to a Bill. There is a property in Fleet Street for which local rates have been paid for some centuries, but no human being can discover its position. Parliamentary plans and reference-books relating to a scheme for rebuilding Fleet Street, if such were prepared, would be declared to be incorrect if the position of the mysterious property did not appear in them. Plans and books should be able to declare with the Northern Farmer, "Proputty, proputty's ivry thing, 'ere," and any omission is, we suppose, only rightly punished by rejection. It is no wonder, then, that during last week and the beginning of this week (Sunday not excepted) so many lights were kept burning in Westminster offices until a late hour, to the amazement of people who passed. The comparison of small plans and enlarged plans, of plans and sections, of plans and reference-books is a tedious and anxious job. Revision after revision may be required before they are brought into correspondence. It has often been found necessary to send in haste to the country to verify a difference on which opinions varied. As the 30th approaches the anxiety increases, unless by good luck, as well as by good management, all tests are found to establish the accuracy of the month's work.

Even at the last moment an error can arise. It is considered right to avoid facilitating reference beyond what is essential. Consequently, if a parish is shown on a sheet and part of a sheet, the whole of the second sheet is not lodged in the parochial offices. But in the hurry of making up the lodgments the part beyond the parish boundaries may be substituted for the part within them. That constitutes a serious allegation against the scheme. On one occasion in a Westminster office, where there was excessive care, the whole of the arranging of the printed sheets was done by the engineers who had taken part in the field-work, instead of by ordinary bookbinders. Repeatedly the sets were checked before they were stitched together. But when the objections came in the first of a long list was found to relate to the incompleteness of the set lodged with the House of Lords. That was like lèse-majesté, and the Examiner on Standing Orders declared he dared not even consider it. The case was sent before a committee, when evidence was heard, and as the omission was ascribed to extraordinary anxiety the plans were allowed to pass. A delay in train service may also prevent the lodgment at a proper hour in a country office, and it can be said there never were plans and reference-books issued from Westminster which were secure against allegations by skilled engineers and Parliamentary agents.

Then a short calm follows. There is speculation whether there are any errors which afford grounds for serious objections. An occasional discussion may arise about the difficulties which will have to be encountered whenever the work is undertaken. Some of the assistants employed being no longer required have to resume other duties, and in general there is in every large office in Westminster a good deal of leave-taking in the early days of December.

The lodging of plans on the 30th does not put an end to preliminary work. Notices have to be served on owners and occupiers, and the difficulty of identification is renewed. Estimates of the cost of the undertaking must also be prepared before the end of December. The amount need only be given in a gross sum, but as the items may be disputed it is necessary to prepare the estimate in detail. The estimate opens as it were a new chapter in the history of the scheme. An engineer and a Parliamentary agent could contrive to do the preliminary work on speculation without incurring ruin. But the declaration of an estimate involves the lodging of a sum equal to 5 per cent. on the amount with the Chancery Division of the High Court. That means in reality one department of the Bank of England transferring a sum to another department; but simple as is the operation it is not gone through without the payment of sterling coin. Owing to inability to gain the requisite sum a great many schemes perish at the estimate stage.

If that stage is passed the calls for money increase. The evidence before the Examiner on Standing Orders has to be met with counter evidence. Fees are also exacted for every demonstration of the existence of the Bill in either House of Parliament. If the committee-room is reached an army of witnesses on one side or the other will appear, with counsel to control them, and expenses multiply in proportion as time runs on. As a rule it is not until August the Parliamentary procedure, which began in November comes to an end, although in cases where the preamble is not proved an earlier termination is likely to be announced. In unsuccessful cases months of excitement and harassing labour too often pass not only without remuneration, but with a waste of money, and those who have had experience do not therefore consider the bustle, which is characteristic of Westminster in November as an unmixed good. But no men are more sanguine than those connected with Private Bills. The less they obtain from fortune in one year the more confident are they in their expectations of the coming Session, and thus it is that the titles of certain schemes become quite as familiar in the offices of the Houses of Parliament as is the last day of November.

ARCHITECTURE IN QUEBEC.

THE complications of the present time, coupled with apprehensions about the future, have compelled Englishmen to take an interest in Canada which must amaze many an ancient colonist. We may therefore expect that a little more attention will be given to Canadian architects and their works. The practice of art in their region is attended with many difficulties. The majority of emigrants can with difficulty persuade themselves to believe that Canada is to be a permanent home for themselves or their families. The climate is trying to many of those who are confident that the hard English weather made hard Englishmen. While they suffer they picture to themselves the delightful orange groves and remarkable fertility which can be found near the shores of the Pacific in the United States, and as they gaze on the pictures of the western Eden which are circulated throughout the Dominion, and realise how cheaply it can be reached, the Canadian climate becomes more dismal. When feelings of that kind prevail who can wonder if men are indifferent about the erection of dwellings which will outlast several generations?

There are other reasons which militate against the erection of business premises of a character which would serve as the memorials of a family or firm. The North American is always in a state of transition, and he has no ambition to be attached to a particular manufacture or business for the term of his life. He is ready and willing to renounce one which he has established and take up another of a different character if he can persuade himself that by the change he is likely to make more profit. When the owner is on the look-out for a change, it is not to be expected that his premises will be suggestive of permanency. Strangers are generally amazed when they see for the first time the temporary character which so many American and Canadian manufactories and business establishments express. But they should remember the restlessness which prevails among the people, and then a collection of sheds becomes significant. The improvements in machinery are also unfavourable to the erection of costly buildings. Time is always superseding machinery, and the buildings which are adapted to one class of power are not easily adapted to suit another class, and on the other side of the Atlantic the endeavour is to possess the very latest aids to increased production.

We find evidence of the obstacles to the erection of buildings that are capable to endure in the proceedings of the annual convention of the Province of Quebec Association of Architects. The new president, Mr. A. Raza, when explaining why so little appeared to be done by the Canadian architect in comparison with his Parisian brother and other representatives of an ancient civilisation, said :—"In America one must build quickly and give large and prompt returns to the client for his investment. The client insists on the greatest amount of rentable space being crowded into his building; in having ladders instead of reasonable and commodious staircases. It too often happens that the greedy speculator shrinks from the idea of consulting an architect, and will call on any stonecutter or wood-butcher to draw the rudiments of a plan, venturing on this to build those ugly and ill-proportioned, ill-matured structures spoiling whole streets nay, even the whole suburbs." Architects who have every day to find themselves met by the general belief that all which is needed is a temporary shelter for residence as for work cannot be expected to be always in good spirits. There are consequently expressions of despondency in the reports of the Quebec Association, admissions that the prosperous time which was anticipated had not arrived, complaints that municipal authorities do not more efficiently co-operate with architects by insisting on the production of plans before buildings are commenced. The supposed happier lot of French architects is referred to in order to bring the condition of affairs in Canada into stronger relief. For example, the President said:—"The Société Centrale des Architectes de France commands the greatest influence and respect. It has been granted the most precious and extraordinary privileges, as every enlightened citizen feels that the honour of the country is centred in its schools of painting, sculpture and architecture." So erroneous a statement could hardly have a beneficial effect on the minds of the Quebec architects. The Société Centrale resembles the Quebec Association, for it also has to express dissatisfaction with the ways of men in authority. The two societies are also alike in being without schools of painting, sculpture and architecture. Mr. Raza was, we suppose, thinking of the Ecole des Beaux-Arts.

Although in Canada, as in England, it is not necessary to employ an architect, the Quebec Association cannot complain of utter indifference on the part of the authorities. It has obtained a privilege which is unattainable in England. The Association now possesses "the right to prohibit unauthorised and unqualified persons from calling themselves architects." In other words, the 138 members are supposed to have a prior claim on all commissions. According to the report:—"The profession is now closed to unqualified practitioners, and only three alternatives are left to outsiders who wish to qualify themselves to practice. (1) Old members having allowed themselves to be disqualified may re-enter by paying their arrears, subject to the action of the council. (2) Members of a well-known sister society who come to settle and practice regularly in the province, by presenting their credentials. (3) Those who shall pass the examination prescribed by the charter and by-laws." The third class will not be numerous, for the report informs us that "the examinations of this year have not been fruitful of success; only one candidate presented himself at the winter examination, but retired on account of ill-health. Three candidates were examined at the summer session, but all failed to matriculate." It is, therefore, proposed to change the curriculum.

As the Association is told it can congratulate itself on having secured an authority that is much coveted by other societies, we suppose the privilege is likely to confer advantages on the members. If "wood-butchers" are carrying off the commissions it is of course right to do something to protect the public against themselves. But is it quite certain not one of the "wood-butchers" has contrived to find a footing among the one hundred and thirty-eight members? In other words, what guarantee have the people of Quebec that the whole of the members are thoroughly competent to undertake the duties of architects? They have not passed any examination or submitted to any tests. Their credentials consist simply of receipts for subscriptions which were paid, and those documents are hardly adequate to satisfy the public about the possession of good taste and competency in construction. As to the future, there must be some kind of training followed in order to succeed in the examinations, and that will be an advantage, but if the curriculum is lowered once, as is determined, there is no reason why the process should not be repeated again and again until the lowest degree of capacity is met.

By obtaining the power of opening and closing the profession to aspirants the Quebec Association must appear a more exalted body in the eyes of those who care to consider such subjects; but dignity in a society, as in an individual, means keeping up appearances of a more costly description. The expenses will therefore be increased; but how are they to be met unless by additions to the membership? For its own sake the Association must therefore produce an easy curriculum, although the members will of course in their own interest desire to see the standard continually raised. The mutual congratulations in which the one hundred and thirty-eight members are told to join can therefore only be temporary.

In Quebec registration may be the least of many evils, and on that account merits adoption. It may, too, be its own reward and impart various desirable qualities. But all that is said by the advocates of the system has a marvellous resemblance to what has been said elsewhere. We should like to see the Association succeed; but we cannot believe that a document, because it is signed by a Lieutenant-Governor and has been mentioned in the *Official Gazette* of Quebec, is sufficient to remove the difficulties which attend architecture in a country like Canada. The future of architecture will be more effectively secured by the education of the people. For temporary premises the wood butchers may serve, but let the fact be once recognised that Canada has many of the conditions which are desirable for a residential country, and we may be confident the people will prefer to obtain designs from architects which will recall the homes of the mother country.

THE EDINBURGH SCHOOL OF APPLIED ART EXHIBITION.

IN the galleries of the Royal Scottish Academy, Mound, an exhibition was opened on Monday, free to the public, of the work done during the past year by the students in the Edinburgh School of Applied Art, of which Dr. Rowand Anderson is hon. director. The school is managed by a joint committee of the Board of Manufactures and outside subscribers, and for several years a contribution of 1,000*l.* was given to it out of the grant-in-aid by the Edinburgh Town Council. This year that sum, in the exceptional circumstances of the city finances, was reduced to 750*l.*, but it is hoped it may be increased again, as the School is doing an excellent work in the equipment of young architects and designers in all branches of art industry for the work that is before them. The attendance last year at the school was between sixty and seventy students, and the mere amount of work upon the walls is evident proof of the industry of the workers. But in addition to quantity there is excellent quality; and it is doubtful if a better exhibition of the kind could be seen in London or other populous centres with a much larger population to draw upon for students. Part of one of the octagons is set apart for the drawings of three students, who, having completed the school curriculum, were awarded travelling scholarships of 60*l.*, 40*l.* and 40*l.* respectively for four months. It is a condition that they must proceed to some art centre, and make drawings for their own improvement of architectural or other work. The first prizeman, Mr. J. Douglas Trail, being a furniture draughtsman, many of his designs are of beautiful pieces of furniture of English and French design met with at South Kensington and elsewhere. The other two bursars were J. Hervey Rutherford and J. Forbes Smith, architects. Their drawings are mostly architectural, and they show also elegant designs for metal and stained-glass work. There are scholarships likewise given of 52*l.* per annum in connection with a national survey of Scotland. Those taking part in this interesting work this year were J. Hervey Rutherford, J. Edwin Forbes and W. Beattie Brown, jun. This scheme embraces accurate reproductions of the best features in the old castles, mansion-houses and cathedrals of Scotland, and if the Society is ever in sufficient funds it is hoped that a careful selection of such drawings may be published for future reference. In the meantime they are being carefully catalogued and preserved against that day. Specimens of work done by the students on Saturday afternoon excursions, in the school by the pupils of various grades, and in modelling in clay, in drawing the figure, and in colour are also shown—the whole forming a most noteworthy display, creditable alike to teachers and to students. To the young men of the city engaged in any handicraft a visit to the exhibition may be cordially commended.

CRITICISM WHICH HELPS.

A NUMBER of years ago Mrs. Scott-Siddons, the eminent reader, says Mr. C. H. Blackall in the *Architectural Review*, was giving an entertainment at a small town in Illinois. The audience was limited only by the capacity of the hall, and was manifestly enjoying itself in the quiet, undemonstrative way which is so characteristic of our rural populations, without indulging in applause of any marked sort. After a peculiarly brilliant rhetorical effort Mrs. Siddons bowed, and as the expected applause did not immediately follow, she flushed a bit, and then suddenly tripped down to the footlights and made a little speech, stating that she believed that the good people of the town did not appreciate how necessary to an artist was the applause of the audience, and how hard it was for her to keep up the spirit which she knew they expected when they gave no sign of the approval which she felt quite confident was in their minds. The speech was very daintily turned, and immediately brought down the house, each succeeding number being loudly applauded. This incident illustrates indirectly the attitude, more or less self-confessed, which every architect cannot but feel towards his work. It emphatically is not good for a man to live alone; and the architect who is able to do his work year after year without recognition, without applause, without favourable criticism, without the kindly pat on the shoulder or the occasional hearty grasp of the hand from a fellow, is not the kind of man who produces very good work. We may call it conceit, or apply any hideous name we please to the quality, but the fact remains that, other things being equal, an architect will do far better work when his efforts are properly acknowledged and received, and he is given the credit therefor which he feels is his due.

This involves the question of criticism—a question which is so vitally associated with growth that it has to be taken account of in estimating artistic possibilities. Criticism of itself does not imply either praise or blame. The aim of criticism certainly is not to whitewash the shortcomings of one's fellows any more than it is to give an opportunity for the critic to display his analytical perspicacity. The fundamental object of all criticism is the improvement of the standard, the benefiting of the one who is criticised, or, by exposition, the analysis of success. Bearing in mind that the very last element of architectural criticism is a mere expression of like or dislike, that if we are to be criticised it should be for our good, intelligent praise of one's work then becomes, in logical sequence, as effectual criticism as a keen, discriminating analysis of one's failures. Every architect has at times the strong feeling of desire to have his work weighed in the balance, intelligently measured, and the reasons for its successes or failures stated to him in such a manner that he may draw hope and strength perhaps even from his failures. The difficulty is how to bring out that criticism in such a way that it shall have its maximum efficiency with a minimum of the gall and bitterness which so often accompanies attempts at architectural criticism.

There are two ways of encouraging intellectual or artistic growth. Perhaps it would be fairer to make a broader statement that there are two ways of fostering education. We can point out the errors, tell wherein the student falls short, tell him what he ought to have done or what he ought to have left undone; that is one way, the fault-finding way, the analytical way, and it is by far the easier way. Humanity is so constituted that it is a much more simple operation to sift out the bad than it is to definitely decide upon what is worthy. The second way, and the way to which educators now are looking as offering the most promise, is to neglect the bad, be blind or indifferent if you will to the failures, but to emphasise such successes as are apparent; to praise the good, keep silent in regard to the commonplace and to develop the good rather than simply exterminate the evil. This is the successful way in kindergarten systems, and we must consider this country as still in its early youth, as not yet by any means attained to even the youngest manhood in architectural matters, but as still a candidate for the kindergarten system in art.

The great lack of our national work to-day is that it is not criticised; that our architects have no fair means of comparing their work with that about them, and the result is that it becomes extremely difficult for the young architect starting in business to keep in touch with the best work and to feel himself in the line of growth, the temptation being sometimes overpowering to fold his hands, to use the architectural expressions which he brought from college and to limit himself to a few forms simply because he dare not go beyond, when, if he could be put within reach of intelligent criticism, the possibilities of growth might be almost unlimited. We must have criticism if we are to grow; not the kind of criticism which is put in the daily papers, which is either blatant advertisement, indifferent condemnation, or, at the very best, an expression of like or dislike; but criticism which is based on sound architectural foundations, which has reason for what it utters and which can be presented in such a way as to appeal to the criticised. Most of those who have undertaken the criticism of contemporaneous architecture have been in a sense dilettanti; but one who never has practised architecture, who never has had to encounter the actual difficulties, practical and æsthetic, that are so emphatically the bone and sinew of growth, cannot criticise the work of architects in such a way that they can feel a confidence in receiving it. Intelligent criticism of architecture must come from architects; it must come from those in our own ranks if it is to be received and profited by. But on the other hand, the frailty of human nature is very loth to be found fault with, and if A tells me that my porch is bad the instant retort springs to my lips that his column is bad, and neither profits by criticism. If I tell a brother architect that he is clear off on his mouldings, that he should have done it so and so, or that his construction was bad, he will think, even if he does not say, that I had better be looking after my own glass windows, and that until I can do better work that he I had better keep my criticism to myself. So that criticism of the destructive type, though of great value to the recipient when fair and unbiased and properly received, is a means of development which is so easily turned into a weapon of offence that its pruning value disappears.

Especially with us who have so few absolute canons of taste, who depend so largely upon our imported ideas, is it difficult to receive a severe cut across some of our pet ideas. We may say that we take it in the best spirit in the world, but we do resent it all the same; we do feel that there was no call for quite so slashing denouncement, and that, after all, if we have made mistakes they are no greater than those of our neighbour. In other words, criticism such as is usually made defeats its own purpose with the party most interested; and, after all, when we consider the matter, why need we point out our fellow creature's frailties? It is like the story of the pilot who did not know where all the rocks were in his ship's course, but he knew perfectly well where they were not. If our criticism can develop the good the result will be just the same as if we eliminated the bad, without wounding any feelings or stirring up any antagonism.

The kind of criticism which is given among the students of the Ecole des Beaux-Arts hurts and stings with its brutal frankness, and the students grow delightfully under it and thrive upon it; but that is because they are students, and accept it as such. When they get out in the world the case is very different. I well remember on one occasion in the André atelier a certain very bumptious young Frenchman who had been feeling quite confident about the excellence of his design, so confident that he felt no desire to call upon the anciens for advice, but went right ahead and had his scheme all worked out on the day the master arrived. The practice was for M. André to spend from three to fifteen minutes on each man's work, pointing out what might have been improved, criticising it always with the most friendly spirit, striving to bring out the best side of the sometimes almost hopeless work before him; but when he came to this young Frenchman's work he sat down in front of it, looked it all over very carefully for a few minutes, and then without saying a word got up, left it and went to the next man. That cut more effectively than the most biting, slashing criticism, and the young Frenchman learned his lesson. In fact, one can often say most by saying least, and the kind of criticism which ignores will sometimes point out errors in the most effectual manner while avoiding the possibility of misunderstanding.

Our critics need not be blind to our faults. We all have them, and so long as we live in an imperfect world, and are ourselves so far from our own ideals, we cannot expect to strike perfection. Rather we have to strike an average between what we can do well and what we want to do, and the criticism which recognises that there is good in every honest effort, which seeks to accentuate that good, and is willing to forego the tempting desire to find fault with what is manifestly crude or wrong, will do more to build up our weak spots, to give us strength where we need vigour, and assurance where we need faith, than if the criticism was of the destructive type. The knife is necessary sometimes. There are such violent manifestations of ill-digested conceit in architecture that a knock-down blow seems about the only fit argument. And yet it is quite possible that those occasions demand far less heroic treatment than our critics might be inclined to believe, and even in some very extreme cases a damning with faint praise would be far more efficacious. We need not give our commendations lavishly, we can be sparing in our pats on the shoulder; but if we criticise each other's work in the friendly spirit, in the uplifting mood, we can at least be sure of a hearing, and can be confident in not arousing the antagonism which might turn our good intent into arrogance.

It is fair to assume that if our most biting critic were to be set down before Rheims or the Farnese Palace, his first thoughts would be of the good proportion, of the beautiful detail, the harmonious ensemble; and, indeed, criticism of the historic work is usually of the constructive type. It is when we consider the work of our fellow men that the destructive element crops out; and there seems no good reason why those who undertake to criticise existing architecture cannot do so from the same points of view that they would criticise the great works of the past, and when a modern building is under discussion point out so fully its strong points that they can afford to neglect the weak ones. And if we who are criticised strive earnestly to repeat our successes, to seek to do the things that commend themselves, our proportion of failures ought to grow beautifully less.

Ruskin may be a questionable guide in matters of architecture, but his advice regarding criticism is always worth heeding. "Do not think of your faults; still less of others' faults; in every person who comes near you look for what is good and strong; honour that; rejoice in it; and, as you can, try to imitate it, and your faults will drop off like dead leaves when their time comes."

TESSERÆ.

The Costliness of Roman Houses.

A CERTAIN Mamurra was the first that encrusted his whole house with marble. After the conquest of Carthage, the ceilings in the Capitol were for the first time gilded; but this species of luxury soon extended to private houses. "We live," exclaimed St. Jerome, "as though we were to die to-morrow, and build as though we should live for ever. Walls, ceilings and columns glisten with gold." Tertullian also speaks of costly tapestry manufactured at Tyre. Columns were an ornament very frequently employed. It was not uncommon to see many hundreds of them in one single edifice, which perhaps had besides a fountain to cool it. The extent of habitations was prodigious. One of the ancients complains that the palace of Augustus took up as much ground as formerly composed the whole farm of Cincinnatus. During Nero's reign some of the slaves of that tyrant possessed fish-ponds which were very large. And Pliny exclaims, "Such were not the habitations of those who founded this empire; they went from the plough or the cottage to triumphs, and their fields were smaller than are now the rooms of their descendants." Sallust and Seneca also compare houses to whole cities. Buildings were immoderately extended, not only in length and breadth but also in height. According to Juvenal, Cetronius built a house which was more lofty than the Temple of Hercules and Fortune; and Posides erected another that even surpassed the Capitol in elevation. Fruit-gardens and pleasure-grounds were enclosed within the walls of such edifices, or even laid out upon the roofs. Fruit trees were highly valued. A single apple tree yielded its owner a yearly profit of 10*l*. These, however, were only common trees; there were others of rarer kinds for pomp or pleasure—for instance, the lotus. Valerius Maximus relates that Domitius accused his colleague Crassus of having adorned his portico with columns from Mount Hymettus. "What do you value my house at?" asked Crassus. "At sixty times one hundred thousand sesterces," was the reply. "And how much lower will you rate it if I cut down ten shrubs (arbusculos)?" "Thirty times one hundred thousand sesterces." These ten shrubs consequently cost 15,000*l*. The palace of Clodius, who was assassinated by Milo, cost 110,000*l*.; it probably contained none of these shrubs or trees, otherwise the expense would have been much greater. Hirrius received merely from the buildings that surrounded his fish-ponds a yearly income of 60,000*l*. This luxury in building spread with extraordinary rapidity. In the consulship of Lepidus and Catulus, twenty-nine years before Julius Cæsar, the house of this Lepidus was the finest in Rome; and thirty-five years afterwards it was surpassed in magnificence by more than 100.

Ratisbon Cathedral.

The west front of the minster forms its most remarkable feature. Flanked by two towers of enormous bulk, the hoary dignity of its general effect seems rather enhanced than impaired by their inadequate height. The whole façade is replete with that commanding force of effect whose accomplishment should ever be the principal aim of cathedral piles. It is only so far too much dilated in its general grandeur that the graces of its beautiful detail are considerably obscured. On a nearer approach, however, that glorious eccentricity the great triangular porch assumes the real proportions of its amazing height, and while lost in admiration of this pavilion and parterre of stone, one cannot but remark how greatly Mediæval architecture had the *pas* of Mediæval sculpture. The imagery seems only subordinate to the general effect of the decoration. The tabernacle-work, the foliature, the fruit and the flowers are of superlative delicacy; the statues do not even pretend an approach to excellence. The interior achieves precisely what all such edifices should: it captivates the eye and smites the heart at a single glance; the spirit of the place at once overpowers and fills us with raptures. Less intricate and more entire in its magnificence than most Gothic fanes, its mighty aisles, its superb porch and its array of painted windows, varnished with all the glories of the crucible and redolent of divine and legendary lore, constitute the chief distinction of the Dom Kirche of Regensberg, and you may see them almost at a glance. Instead of deep recesses in the aisles, this church possesses the peculiarity of six projecting shrines of tabernacle-work, each a chapel in itself. Among these is the font, a very remarkable construction of its kind. It is a huge polygonal draw-well, having sculptured panels under a stately arch of tabernacles and imagery, flanked by two Gothic basins of marble, each supported by a spiral column. These, doubtless, are accustomed to contain the sacramental element. The exterior is of great simplicity. They have evidently lavished all their luxuriance on that unparalleled west front.

The Medusa's Head.

Although the Gorgon's head is often seen in the centre of Minerva's shield, it still more frequently appears upon the ægis, but the ægis is quite distinct from the shield. The ægis was originally a goat-skin, and when Jupiter was contending with the Titans he was directed to wear it with the head of the Gorgon. Homer designates Jupiter by the title of Ægis-bearing, and from this circumstance the goat-skin became the mantle or paludamentum of the Roman emperors, and the Medusa's head at last degenerated into a fibula or button, with which the cloak was fastened on the right shoulder. The Roman emperors, in the character of Jupiter, wore the ægis, as seen upon the splendid cameo of the Emperor Rudolf now at Vienna. But we are more accustomed to see the ægis in connection with Minerva; she wore it in various shapes and ways, frequently as a skin, covered with small scales and fringed with serpents, and sometimes as a band, very often as a cape round the neck, fastened in front with the Gorgon's head. This we may observe, that when the goddess is fully armed the Medusa's head never appears upon the ægis and buckler also. There are abundant examples of the Gorgon's head occupying the centre of her shield, but it was not so in the celebrated

statue by Phidias in the Parthenon, and is probably not to be found in the earlier specimens of art in that position. We do find it so placed on the coins of Antiochus, Philip, Antigonus of Pergamus, and upon numerous Roman bas-reliefs. One form of the Gorgon's head appears upon copies of Roman sculpture and pseudo-antiques, which deserves a caution: it is the distorted countenance of a beautiful female bristling with snakes and her mouth wide open, as if screaming to the utmost extent. This is not antique and certainly not in accordance with the taste of the early Greek artists. They represented the Gorgon hideous, with terrific teeth and something of a fiendish grin upon the countenance; the tongue also was made to protrude, as may be seen not only upon painted vases but upon numerous coins, both Greek and of the Roman families. During the more refined period of art the hideousness was set aside and a type "severe in youthful beauty" was adopted. A curious instance of a Medusa head with the tongue protruding occurs on the large round shield of a statue of Minerva found in this country, and now in the possession of the Duke of Bedford. Raphael has introduced the same type of pseudo-treatment in his grand picture the *Cycle of Philosophy*, commonly called the "School of Athens." Michel Angelo da Caravaggio has bestowed the utmost effect that art could display in a similar treatment of the same subject. The picture now in the Gallery of the Uffizi at Florence is painted upon a convex surface, and it is a true observation that "as you turn the eyes appear to follow you." The same gallery contains another modern example of Medusa, by Leonardo da Vinci. The great painter has here adopted a truly poetical treatment: the head, severed from the body, lies neglected on a desert waste; the back part turned toward the spectator, so that all may gaze with impunity (mark the contrast to Caravaggio); the mouth is evidently open, but from this point of view not disagreeable. The last breath, like a dense cloud of steam, is seen issuing forth, and venomous reptiles and creatures of darkness are approaching, not for prey but eager curiosity, and only held back by fear whilst the faintest symptom of life remains. The eyes, although averted and foreshortened, are terrific to behold; but the main part of the picture, because nearest in front, is the serpents, who still seem writhing, and exhibit every variety of exhaustion and suffering. Some are already dead, others stretched along lifeless in all but their head, others spending their last passion in violent contortions, and two seem to meditate a revengeful attack upon the now sightless eyeballs of the pale and beautiful countenance. But all are dying. For poetry and accurate imitation of nature this picture well merits the praise and admiration so frequently awarded to it.

John Leech's Sketches in Oil.

Leech was singularly modest, both as a man and as an artist. This came by nature, and was indicative of the harmony and sweetness of his essence; but doubtless the perpetual going to nature and drawing out of her fulness kept him humble as well as made him, what every man of sense and power must be, conscious of his own strength; but before the great mother he was simple and loving, attentive to her lessons as a child, for ever learning and doing. This honesty and modesty were curiously brought out when he was, after much persuasion, induced to make the coloured drawings for the exhibition of his sketches in oil, which was such a splendid success, bringing in nearly 5,000*l*. Nothing could induce him to do what was wanted—call them paintings. "They are mere sketches," he said, "and very crude sketches, too, and I have no wish to be made a laughing-stock by calling them what they are not." Here was at once modesty and honest pride, or rather that truthfulness which lay at the root of his character, and was also its "bright, consummate flower," and he went further than this in having printed in the catalogue the following words:—"These sketches have no claim to be regarded or tested as finished pictures. It is impossible for any one to know the fact better than I do. They have no pretensions to a higher name than that I have given them—sketches in oil." The origin of these sketches in oil is curious. Leech had often been asked to undertake works of the character, but he had for so many years been accustomed to draw with the pencil, and that only on small blocks, that he had little confidence in his ability to draw on a large scale. The idea originated with Mark Lemon, his friend and colleague, who saw that by a new invention the impression of a block in *Punch*, being first taken on a sheet of indiarubber, might be enlarged, when by a lithographic process the copy thus got could be transferred to the stone and impressions printed upon a large sheet of canvas. Having thus obtained an outline groundwork consisting of his own lines enlarged some eight times the area of the original block, Leech proceeded to colour these. His knowledge of the manipulation of oil-colours was very slight, and it was under the guidance of his friend, John Everett Millais, that his first attempts were made, and crude enough they were. He used a kind of transparent colour which allowed the coarse lines of the enlargement to show through, so that the production presented the appearance of indifferent lithographs slightly tinted. In a short time, however, he obtained great mastery over oil colour, and instead of allowing the thick fatty lines of printers' ink to remain on the canvas, he by the use of turpentine removed the ink, particularly with regard to the lines of the face and figure. These he redrew with his own hand in a fine and delicate manner. He added a delicacy of finish, particularly in flesh colour, which greatly enhanced the value and beauty of his later works.

Arrangement of the Greek Stage.

The massive and permanent walls of the Greek stage had certain openings which, although differently decorated for different pieces, were never changed. Each of these entrances to the stage had its established and permanent signification, and this enabled the spectator to apprehend many things at the first glance, which he must have otherwise gradually made out in the course of the piece, since contrivances similar to our play-bills were unknown to the ancients. On the other hand, the audience came furnished with certain preliminary information concerning what they were about to witness, by means of which the plot was far more clear to them than it can now be by mere reading. Of this kind was the distinct meaning attached to the right and the left side. The theatre at Athens was built on the south side of the Acropolis, in such a manner that a person standing on the stage saw the greater part of the city and the harbour on his left, and the country of Attica on his right. Hence, a man who entered on the right by the parascenia was invariably understood to come from the country or from afar; on the left, from the city or the neighbourhood. The two side-walls always bore the same relation to each other in the arrangements as to exterior or interior. Of course, the lower side entrance which led into the orchestra stood in the same relation; but of these, the right one was little used, because the chorus generally consisted of inhabitants of the place or of the immediate neighbourhood. The main wall, however, or the scene, properly so called, had three doors: the middle, which was called the royal door, represented the principal entrance to the palace, the abode of the prince himself; that on the right was held to be a passage leading without, especially to the apartments of the guests, which in Greek houses were often in a detached building appropriated to that purpose; that on the left, more towards the interior, leading to a part of the house not obvious to the first approach, such as a shrine, a prison, the apartments of the women, &c.

Decorated Characteristics.

Arches mostly enclosing an equilateral triangle, the mouldings often continued down the pier. Windows large and divided into two or more lights by mullions; tracery in the head at first composed of geometrical forms, later of flowing character. Clerestory windows generally small. Diamond-shaped piers with shafts engaged. Capitals with scroll moulding on under side of abacus, with elegant foliage arranged horizontally. Bases generally formed of quarter round and scroll moulding. Doors frequently without shafts, the arch moulding running down the jambs. Rich doorways and windows often surrounded with triangular or ogee-shaped canopies. Buttresses worked in stages, variously ornamented with moulded slopes, triangular heads, with panels and niches. Corner buttresses often placed diagonally. Parapets pierced with quatrefoils and flowing tracery. Niches panelled and with projecting canopies. Steeples lofty and well-proportioned. Roofs of moderate pitch open to the framing. Fonts mostly octagonal, with quatrefoils and tracery on sides. Mouldings bold and finely proportioned, generally in groups, the groups separated from each other by hollows, composed of segments of circles. Deep hollows, principally confined to inner angles. Mouldings varying in size and kind, on chamfer and rectangular planes, often ornamented with ball flower. Foliage, chiefly of ivy, oak and vine leaves; natural. Rich crockets, finials and pinnacles.

Universal Applicability of the Italian Style.

The Italian system is universally adopted without any material changes. It is found to suit all climates; it is the architecture for the manufactory, the dwelling-house, and—with the exception of England—for all public buildings and churches. It presents no signs of decay, though most ancient. Noble as it now is, it has been the work of progressive creation, adapting itself to the wants of those who required its aid; never retrograding, but continually, as it were, in bud, and still so despite the efforts made to control it. We cannot understand the principles on which it advanced without studying the works of those great men who have gone before us, and then we observe that they all invented. Certain points of similarity are unavoidable in art; supports and coverings are necessarily the same. Still, there are other points in which each one either trusted a little to his own original invention, or produced something of equal value by a reproduction and improvement of what had been done before.

NOTES AND COMMENTS.

AMONG other effects of VICTOR HUGO'S genius was the creation of interest in the Cour des Miracles, that strange sanctuary or refuge where the drones of the social hive of Paris were safe from the officers of the Châtelet and the Prévôt. It was there, as can be read in "Notre Dame," the poet PIERRE GRINGOIRE was sentenced to be hanged, and was saved by the gipsy girl ESMERALDA. There were several cours in old Paris where the blind recovered their sight, the dumb became loquacious, and cripples displayed agility. But HUGO'S Cour des Miracles, although it is difficult to fix its position, is always certain to be the only Bohemian sanctuary in the popular mind. It is, therefore, a happy thought to have a realisation of the place, with its quaint architectural surroundings, forming a part of the Paris Exhibition of 1900. M. COLIBERT, the architect who is thus inspired, was one of VIOLLET LE DUC'S pupils. He has given proof of his competency to reconstruct a bit of old Paris by his "Bastille," which was one of the attractions of 1889. M. COLIBERT contemplates the presentation not only of the cour, but of a part of the neighbourhood, with the ancient wall and probably the cathedral of Notre-Dame. For the old structures will be only an environment for the presentation of some of the most startling incidents of VICTOR HUGO'S romance, and a revival of the picturesque processions which were as characteristic of Paris in the fifteenth century as the old buildings.

As architects few of our readers can take a professional interest in the proposed college at Khartoum. All that is contemplated for the "initial outlay" is only 10,000*l.*, and of that sum merely a fraction would be expended on building. The kind of construction that prevails in the Soudan is primitive, and we suppose would be followed. In course of time, when the people become civilised, they will be able to appreciate a better class of work. But architects, no less than the rest of their fellow countrymen, will rejoice to see a memorial of GORDON which would be most pleasing to that hero. The schoolmaster will be a more useful emissary of civilisation than a filibuster. If we wish to have an easy time in the Nile Valley we must begin with the training of children, for, as Lord SALISBURY well says:—"It will tax the resources of the present generation, and of those who come after them, for many years before the wall of prejudice can be thrown down which separates the thoughts of the European and the thoughts of the Egyptian and the Soudanese races, and until it is to a considerable extent accomplished, we cannot count securely upon their co-operation, either in the duties of government or in the promotion of industrial progress. The only method by which this reconciliation can be attained is to give to the races whom you have conquered access to the literature and knowledge of Europe."

WHEN it was arranged that national museums and art galleries were to be opened on Sundays, the work for which the Sunday Society was constituted over twenty years ago came to an end. It was then decided that Mr. MARK H. JUDGE, architect, who, at much sacrifice to himself, acted as honorary secretary during the whole period, deserved a testimonial. A committee was formed, and on application for subscriptions to the members and friends of the Society a satisfactory response was obtained. It was felt, however, that others would be desirous to aid in recognising Mr. JUDGE'S services. The fund will accordingly be kept open until Christmas, and subscriptions can be forwarded to the honorary secretary of the fund, Dr. CORFIELD, 19 Savile Row, W.

THE late CHARLES DICKENS was not an enthusiast about architectural works, or indeed works of art of any kind. But even he described the Ponte Vecchio at Florence as a most enchanting feature in the scene. He continues:—"The space of one house in the centre being left open, the view beyond is shown as in a frame, and that precious glimpse of sky and water and rich buildings shining so quietly among the huddled roofs and gables on the bridge is exquisite." In saying this DICKENS expressed the opinion of even the humblest tourist. The Ponte Vecchio is now threatened with destruction, and when one remembers how much that was historical in the city has been sacrificed to commonplace buildings, there is not any likelihood the bridge will be preserved, unless the multitude of British and American visitors will protest against the vandalism. The piers of the Ponte Vecchio are supposed by some archæologists to have formed part of an Etruscan bridge, but there can be no certainty on the subject. All that is known is that a bridge existed there in 1080, that one was carried away by a flood in 1177, and another in 1333. The existing bridge which succeeded the last is the work of TADDEO GADDI. There were always shops erected on it, and according to tradition MASO DI FINIGUERRA was a tenant of one of them, and produced some of his best work in it. There is enough historical interest around the bridge to preserve it, for similar structures of its date are becoming rare. But the Florentines apparently have set their desires on a metallic structure, as more representative of modern Italy.

ALBERT DÜRER gave much attention to lettering, and endeavoured to work out a system of proportion for Gothic minuscule. It would be difficult for any painter, engraver or caligraphist to observe the artist's instructions; but DÜRER was simply giving way to a fascination which is always likely to be powerful. Although small and commonplace, letters involve many problems, and to devise an alphabet of novel forms which would be generally used would be almost enough to secure reputation. The 150 alphabets which Mr. LEWIS F. DAY brings together in his "Alphabets, Old and New" (B. T. BATSFORD), are enough to suggest the amount of ingenuity which has been exercised on a subject which is so simple. But with all the simplicity there are many things which are not easily understood. How is it that the type used in a Paris newspaper differs in form from the type of London and Rome, and that European type is to be recognised as differing from American type? Again, why should there be such a difference between the type of the eighteenth and the nineteenth century? Mr. DAY'S selections go back to the fourth century, and he gives a great many varieties of his own devising. The book is, therefore, sufficiently comprehensive. Some of the attempts at novelty are not always interesting, and suggest indifference to form, but the majority reveal skilful training and respect for principles. Several of Mr. DAY'S designs show the influence which the instrument employed for lettering can have on the forms. In this country there is not much scope for variety, but the Germans are constantly exercising their invention in caligraphy. In Mr. DAY'S book an abundance of patterns will be found for copyists, while those who endeavour to be original have much which is inspiring. The collection is at once practical, historical and imaginative.

DURING the present session of the Leeds and Yorkshire Architectural Society the following papers will be read:—A Cruise in the Eastern Mediterranean, by Mr. JOHN TWEEDALE; Brickwork Tests, by Mr. MAX CLARKE; Sienna and BALDASSARE PERUZZI, by Mr. FRANCIS W. BEDFORD; Byzantine Architecture in Constantinople, by Mr. A. E. HENDERSON; A Summer in Umbria, by Mr. H. M. FLETCHER; British Plaster Work: its Past and Future, by Mr. G. P. BANKART; Steel Construction in Buildings, by Professor GOODMAN.

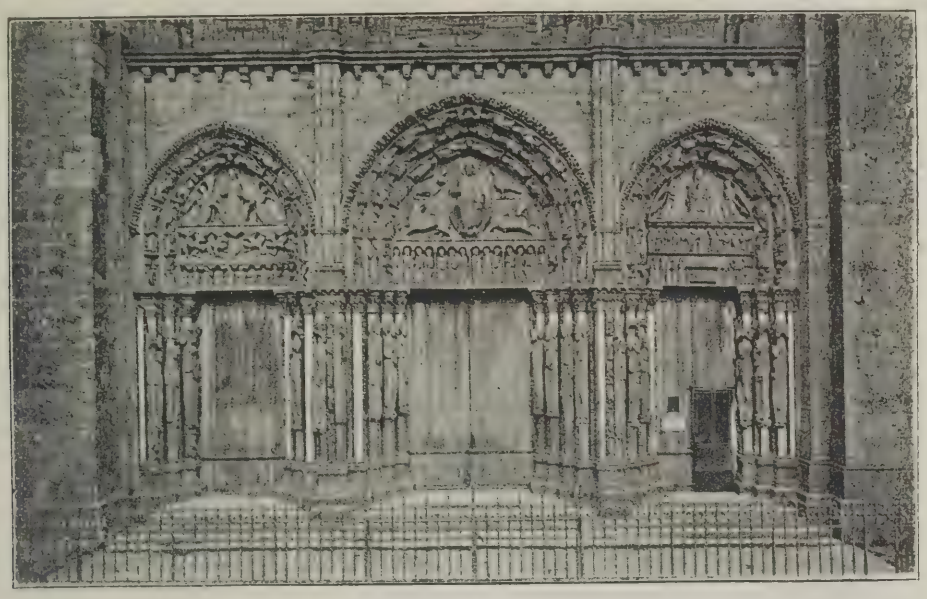
CLARIDGE'S HOTEL.

ON the view of the new Claridge's Hotel, which appeared in last week's *Architect*, Mr. C. W. STEPHENS'S name should have appeared. The building was designed by him, and carried out under his superintendence. The work of Messrs. ERNEST GEORGE & YEATES was limited to the hall, staircase and reception-rooms of the ground floor. The error was accidental, and we much regret its occurrence.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

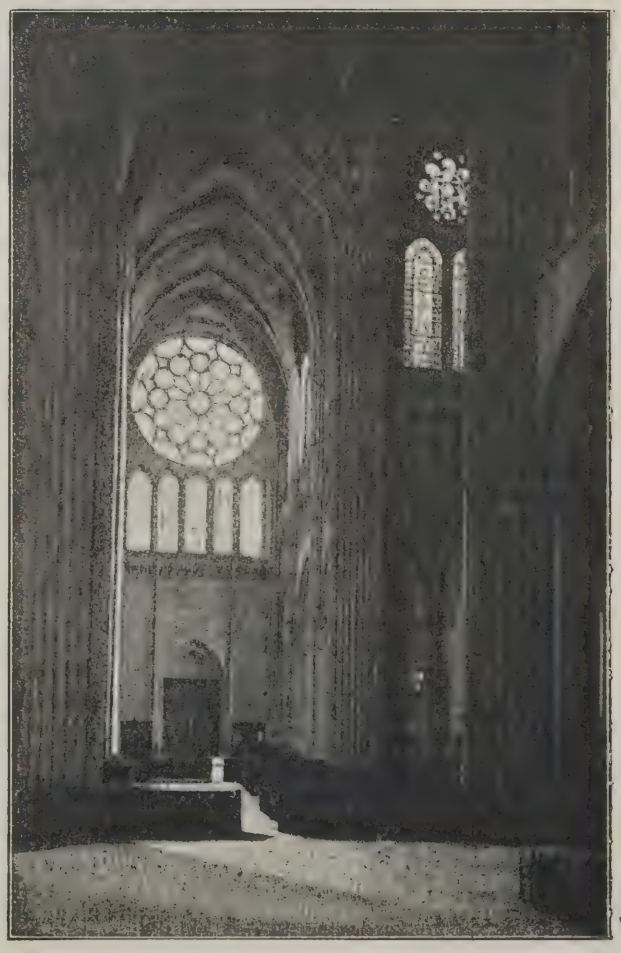


(*Continued from page* 347.)

IV.

Chartres.

A SUNDAY in Chartres! What can be more delightful? Such are our thoughts on waking at the Hôtel Grand Monarque in this most enchanting of French cathedral cities on August 6, the festival of Our Lord's Transfiguration. It is but six o'clock; however, we throw aside the "jalousies" of our windows, and a lovely patch of blue sky greets us above the hotel courtyard, on whose red-tiled roofs some white pigeons are cooing and pluming themselves as if in celebration of the day. An omnibus about to start for the purpose of conveying to the hotel anybody who may happen to arrive by an early train, waits below; the horses are stamping on the paved courtyard, tossing their heads, jangling their bells, champing their bits, and snuffing the fragrant morning air. Presently the great bourdon from Jean Texier's exquisite steeple booms over the city for the six o'clock Mass, but except for these sounds the stillness of early morning is unbroken.



The omnibus has clattered off; we have sacrificed to the Graces, and on descending to the courtyard find

Chartres Cathedral: Western or Port Royale.

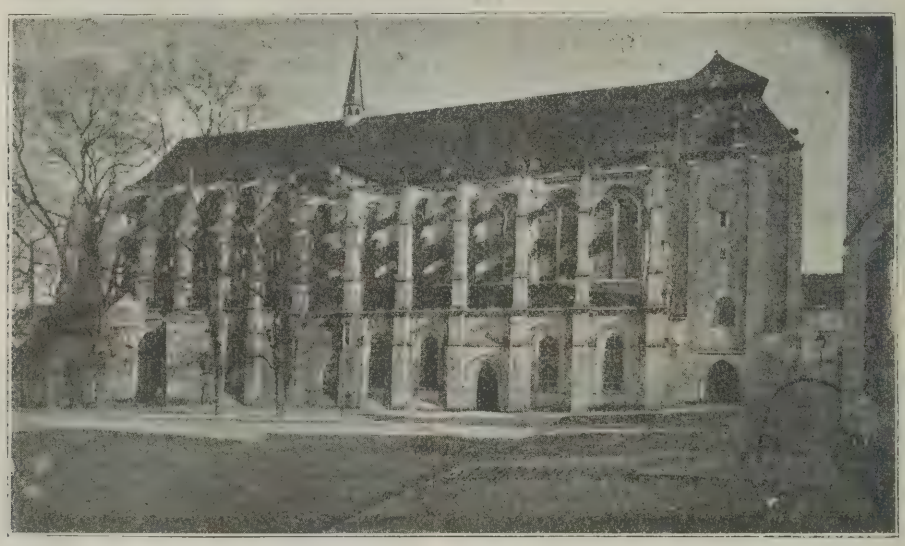
Chartres Cathedral: Vieux Clocher and South Portal.

Chartres Cathedral: View across Transept, looking South.

Mignon and Toby, who advance with erected tails to give us a morning greeting, the latter accompanying us as far as the *porte cochère*, and after wishing us *au revoir* in a few staccato barks, trots back to the culinary regions, with the self-satisfied air of a dog who has done his duty.

Wending our way across the sunny Place d'Epars towards the cathedral, we find that we are not the only persons abroad at this early hour, for we soon fall in with quite a stream of old *citoyennes*, all looking so neat and fresh in the simple black dress, shawl, and closely fitting white cap. *Paroissiens* in hand —wrapped in some instances in a white pocket handkerchief— the dames on reaching the "Close" pursue their different ways. Some enter the great dim cathedral by the Port Royale, or one of those grand transeptal porches where colossal figures of apostles and prophets, priests and kings keep guard, to one of the Masses about to be celebrated in the chapels round the choir. Others descend a little flight of steps in the base of a tower flanking the north transept. We follow them, turn to the right, traverse a passage, open a glass door and find ourselves in perhaps the most awfully solemn religious interior of Christendom—the crypt under the north aisle of Chartres Cathedral. To our right (westward) this crypt is comparatively light, having small windows in its north wall revealing frescoed historical subjects on the opposite one. Eastward, a most impressive picture is presented by the long aisleless vault, depending for light upon the lamps suspended at intervals, or by the private candles placed by the devotees on their chairs, but culminating in a perfect blaze where, above the altar, round which numerous lamps and candles are burning, and at which the white-chasubled priest is moving softly to and fro, sits enthroned one of the two figures of the Virgin so venerated at Chartres—that of Notre-Dame de Sous-terre. We do not linger long here, being anxious to regain the morning air. Daws are wheeling round and round those matchless spires which rise up into the cloudless blue heaven, chasing each other in and out of all sorts of nooks and crannies, while uttering their cheerful "Jack! Jack!"

The contrast presented by these two western spires of Chartres Cathedral—we may not inaptly term them the Alpha and Omega of spires—is most striking.



There is a Doric simplicity, a solemn grandeur of design, in the south-west or Vieux Clocher, but it was robbed of its true proportions when the raising of the western façade took place after the fire which, occurring thirty years after its completion, caused the reconstruction of the church on a much more grandiose scale.

The other spire, the work of Jean Texier, is too of its kind unsurpassed, and though the antipodes of the Vieux Clocher in every respect, groups well with it from all points of view, and thus we are in possession of two steeples each in itself a *chef d'œuvre*.

There is neither central lantern nor flèche at Chartres, a feature that becomes rarer in France the further one travels from the English Channel; but steeples, which at present rise no higher than the spring of the gables, were designed to flank the transepts, as at Rouen and Rheims.

A saunter in the precincts of this titanic pile, and we enter by the richly sculptured Port Royale, whose illustration in our text precludes any detailed description. So dark is the cathedral on entering it from the bright sunshine outside that only after the lapse of some moments are we able to discern the details of the building, very dark in its western part, increasing in luminosity towards the great crossing, but with the choir and apse bathed in the glorious early morning sunshine.

The silence is unbroken, save every now and then by the tinkle of a bell in some remote chapel, or by the occasional footfall of a devotee on the way thither along the dusky nave aisles. The silver pipes of the great organ, by-and-by to pour forth its voice in the showy Interlude or Offertorium, gleam out from the dusky heights of the clerestory, where, as at Metz and Strasburg, it is disposed with such grand effect. The gigantic piers supporting the simply moulded arches which divide the nave from its aisles are on the very common French plan of four shafts surrounding a central drum. At Chartres these cores are alternately circular and octagonal, the circular ones having their attached shafts octagonal, and *vice versâ*. All have foliaged capitals, bold almost to coarseness. In plan and arrangement these columns at Chartres are assimilated to those in St. Hugh's Choir at Lincoln, with which they are contemporary.

Chartres: North Side of St. Pierre.

The uniformity in the design of this great church is not the least interesting of its features. Begun in 1194, and completed in all essentials in 1260, one fails to discover any evidence of a change from the first scheme during the long progress of the work. Nothing seems to have been left for subsequent ages to carry out, the only accretions observable being the chapel of St. Piat opening out of the eastern ambulatory, and that of Vendôme, which forms an agreeable break in the line of the south nave aisle. The dates of these additions are respectively 1340 and 1415.

Throughout the aisles, and in the clerestory of the great apse, the lancet window prevails, while in the clerestory of nave, choir and transepts the fenestration is effected by coupled lancets surmounted by an immense plate-traceried rose formed of an octofoil, round which are sixteen small quatrefoils, the whole seemingly cut out of a slab of stone, and contained beneath a discharging arch, whose semicircular form assists in imparting a quasi-Romanesque air to the pile externally. Each of the great lancets composing these clerestory windows is 8 feet 5 inches in the clear; their only moulding is a chamfer, and the painted glass with which the whole series is filled is in

quantity and quality unrivalled. Executed chiefly at the same time as the building, these windows form, together with those of the aisles, a most interesting study of the progress made in the art of glass painting during the first sixty years of the thirteenth century, single figures occupying the former, and small subjects treated medallion-wise the latter, and their interest is enhanced a thousandfold when we recollect the glorious pageants their ruby stains have assisted to exalt and the storms and revolutions which seem to have left these masterpieces of the vitreous art unscathed.

Seating ourselves in a chair with our back to the central western door, we have on either hand the Transitional respond of the nave of the cathedral burnt down in 1194, and we remember that the three doors and windows now admitting to, and lighting the west front of, Chartres Cathedral served for the nave and aisles of this former building, of which they and the tower bases form the only remains. When the present

CHARTRES: INTERIOR OF ST. PIERRE.

great nave was begun after the fire in 1194 it was made to enclose the whole space occupied by the old cathedral, aisles and all; hence the singular width and colossal proportions of the present church. To our left and right is graceful Transitional work, arches on piers with Corinthianising capitals admitting into chapels formed in the bases of the towers. The baptismal chapel is on our left, the Chapelle du Calvaire on our right. Here is one of those enormous crucifixes so frequently seen in the French churches, and erected, like many others, in commemoration of the mission held in 1826. Seen subsequently on Sunday night at sunset, this crucifix, rising to the roof, had a most solemn and awful effect. Passing up the shallow flight of steps which lead from the floor of the nave to the aisles, we pace them silently, glancing *en passant* at the Chapelle de Vendôme with its tall Flamboyant window, the only relief to the prevailing sternness of the cathedral, and crossing the vast transeptal space, gain the choir aisle; but as early Masses are proceeding at two or three altars here we are unwilling to disturb those attending them; so, postponing our visit to this portion of the building for the present, retire to a secluded seat near the great southern transept door. Here is the bénitier, for at Chartres you are not confronted immediately upon entering, as in many Parisian churches, by an old person who holds a brush protruding with a dozen fingers made of bristle. Anything less suggestive of the beauty of holiness we cannot imagine. It is ugly, slovenly, greasy—in short, filthy. No, at Chartres the bénitiers are large and filled with pure, clean water, and while sitting near this particular one it is touching to notice the smallest children making ineffectual efforts to reach the stoup, till some elder comes along to the rescue and gives the little ones the water wherewith to cross themselves.

By way of "appetiser," we take an airing, and are presently threading the steep intricate streets of the Basse Ville. Here cats are sunning themselves at doors, and almost every *rez-de-chaussée* is the scene of much slopping and besoming by sturdy bourgeoises in sabots to make all taut and trim for the day. Now we are in front of St. Aignan, a quaint mixture of Gothic and Grecian, but how picturesque. It is a simple structure, like a huge ark outside, with not even a spirelet to mark the separation between nave and choir. Let us enter by the enchanting little Renaissance door at the west end of the north aisle. We find ourselves in a fairy church of translucent colour, not so gorgeous or deep, perhaps, as the Sainte-Chapelle at Paris, or Notre-Dame de Bon Secours at Rouen, but exceedingly

CHARTRES CATHEDRAL: THE WEST FRONT.

devotional. But how come Romanesque clerestory and triforium to surmount a somewhat fragile-looking Flamboyant arcade, anyone unacquainted with the history of St. Aignan will ask himself on seeing it for the first time. The fact is, this church is a very, very clever imitation, but not the correct thing. Buildings of the same age as St. Aignan (1623) require a very practised eye to mark the distinction between original and copied work, so admirably did the seventeenth-century architects adapt the early Mediæval styles. What the fancy of the architect of St. Aignan was for putting a triforium of small Byzantine Romanesque arcades and a simple clerestory of round-headed windows over his Flamboyant arches we cannot say. And he has surmounted the whole by a wooden coved roof with tie-beams (of the same character as that employed by Burges in his early French Gothic churches at Brisbane, Cork and Stoke Newington), charming in its simplicity and for its appropriateness.

Still descending, we gain a stone bridge crossing a little stream, and stay awhile admiring the picturesqueness of the whole scene—the great cathedral occupying the summit of the hill and the centre of the city, towering like a mighty giant over the dwellings of the people that seem to cling to it for protection, and, nearer in view, the apsidal east ends of St. Aignan and St. Pierre.

Towards the latter we now bend our steps, glad to escape

from a dusty and uninteresting boulevard into the old town again. St. Pierre is a grand church, resembling in plan some of those built by the Preaching Orders in Belgium and Germany, and consisting of a lofty clerestoried nave and chancel under one line of roof, the separation between the two being marked by a slender flèche. There is a very early tower at the west end, but it only rises to the height of the present

Chartres : A Note in the Nave.

nave clerestory. The oldest part of St. Pierre is the arcade and apse of the choir, in very early First Pointed. More advanced than, but not unlike that of the cathedral, is the nave arcade, with its towering clerestory of tall windows—broad lancets in couples, with a very small circlet within the discharging arch. Next in point of date is the Middle Pointed glazed triforium and clerestory of the choir, forming a perfect lantern of old glass little inferior to that in the cathedral. We stroll for a short time round the aisles of St. Pierre, where in the lady chapel are the celebrated Limoges enamels, now covered with white veils. Having seen these interesting enrichments on a previous visit to Chartres, we do not accept the polite invitation, "Pour voir les émaux il faut s'adresser au sacriste : sonnez S. V. P."

Returning to the cathedral at the conclusion of a *petit premier déjeuner* in the courtyard of the Grand Monarque, we circumambulate the choir aisles with their matchless sixteenth-century screens—a New Testament history in stone—and presently arrive at the celebrated black image, "la Vierge Noire du Pilier."

(*To be continued.*)

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, Mr. G. H. Fellowes Prynne, president, in the chair.

Messrs. L. Blanc and Woodroofe were elected members.

A vote of thanks was passed to Mr. Batsford for the donation of several books to the library.

Mr. Paul Waterhouse read a paper on

Oriel and Bay Windows.

There is something unusually humane about the rule of the Association which lays before the readers of papers not merely he duty of producing an oration, but the subject of the discourse. The ordinary untempered request for a paper brings with it a double horror, for with the honourable burden itself there comes the duty of selection—a duty which, as the paper writer passes in review the possible titles of possible essays, so fills him with the sense of his own ignorance that the process of choice becomes merely a process of rejection, followed eventually by recourse (or shall I say relapse?) into some faltering selection of a theme where for the moment the mist of nescience seems to hang less thickly than over the surrounding regions of architectural learning. The course adopted by the Association is more humane. The committee gives one a subject—by what process of papers in hats or balls in ballot-boxes I do not profess to know—a subject and a man are mated and for better or worse are introduced to one another. There is a blessing in the system—it saves a world of trouble, and is the means of introducing a large number of middle-aged practitioners to subjects of which they had previously no knowledge whatever. For the writer who is faced by an unresponsive title goes to his "Parker's Glossary" and his "Architectural Dictionary," drinks eagerly if not deeply at these fountains of knowledge, and comes smiling to his audience, refreshed with the sense of having put himself at least abreast of common knowledge in the subject which he has so lately made his own.

Alas ! for the students of oriels and bay windows ; the dictionaries give them but cold comfort under either heading. You will find there, to be sure, a wonderful turmoil over definitions and derivations. You will learn there that some consider the word oriel to be originally and properly applied to the projecting windows of Mediæval dining halls, or to that part of the refectory occupied by the monks who were slightly indisposed, while others hold that it originally connotes a recess for an altar or for prayer, whether a window or not, and that it certainly cannot properly be applied to the bay window of a banquet hall.

Orare, to pray, is, say some, the foundation of the word, making it, apparently, synonymous with "oratory," while others see in it the Saxon for an "eye-hole," though why they should overlook the fact that oreille (a seventeenth-century spelling of the word) means an ear and not an eye, nor why again the oriel window should be considered more of an eye-hole than any other kind of window is more than I can say. Another derivation connects it with *areola*, a diminutive of area, which in certain senses is equivalent to the "halo," of Greek origin—and, indeed, the similarity of the term aureole (undoubtedly based on *a reola*) favours this source, which is probable enough when one considers that circularity is the essence of the "halo."

Plunge, if you desire it, into the controversy on this topic in the sixth series of "Notes and Queries," and you will learn at least enough to induce you to drop the use of the word altogether.

Probably you will conclude with me that the ancients used the term a good deal more loosely than even we are tempted to do, and that an oriel like a "yorker" and a "gentleman" is one of those things which can be better understood than defined; also that it makes no great matter, for example, whether you restrict the term to bay windows which are corbelled out, or extend it to those whose form continues down to the ground.

Busybodies have been at work, too, even with the innocent term bay window, which most people can understand by the light of nature as meaning a window whose bulging form, whether polygonal, semicircular, or segmental, produces on plan a bay-like addition to the room it affects. But some wiseacre has produced a glossary of terminology to qualify the word. We are taught, for instance, of the "square bay" and the "canted bay," of the "compass bay" and the "square and compass bay," of the "bow bay" and the "square and bow bay," and, lastly, of an elliptic horror entitled the "cabinet window."

A modern tradition often enforced upon young gentlemen under articles of pupilage confines the term "bow" to the circular forms, and "bay" to the rectangular or polygonal, while yet another refinement of etymology would banish the word "bow" altogether.

Let it suffice to say on this unprofitable topic that the ancients call them all bays, whether they had or had not angles in their composition, and that there are many examples to which we cannot deny ourselves the luxury of applying the gracious and expressive term bow.

Thinking the matter over it has seemed to me that we may well avoid in this evening's discussion both the etymological question and the archæological. An historic treatment seems undesirable, and even the constructive aspect, important as it is, may well be laid aside for a season in favour of the attractive subject which I may call for want of a better title "The Morality of the Bay"—I mean its properties and its proprieties, and the rights and wrongs of its uses and significations.

Has it ever occurred to you in thinking about bays that they are bound to be either the glory or the shame of the building to which they are applied ?

A bay window is, in the literal sense of the word, an extravagance, by which one means not merely the escape of

money from somebody's pocket, but a deliberate variation and wandering out on the part of a building from the normal boundary lines of common construction.

Now, it is in the nature of extravagances of all sorts that they must either be successes or failures, and the rule applies to bows and bays. They challenge attention both from within and from without, and if the attention they attract amounts to unfavourable criticism they bring shipwreck on the building they encumber.

Let us think of the objects for which these excrescences exist. They are few, and consist of :—

1. The desire to increase either the size or the amenity of a room.

2. The desire to enable the occupants to look out obliquely or even sideways without putting their heads out of window.

3. The desire to attract oblique sunshine to a room ; or finally,

4. A desire which is at once the most attractive and sometimes the most fatal of all—pure ambition of a worthy or unworthy kind. Ambition is as happy in its literal application as was the word extravagance. Meaning as it does a certain "going round" it touches in its primary and literal no less than in its secondary senses the essence of the ambient bow.

It may seem absurd to some of you to go thus intimately into the rationalities of an architectural feature ; but I suspect that we architects can lose nothing by any attempt to study the true significance of any of the items out of which we compile our compositions. There is one special reason for thought in dealing with such a matter as this, namely, that if we find ourselves dealing with bay windows merely for looks, it is of vast importance to be sure of their excellence and of their propriety. I am not arguing that utilitarian reasons only are the proper grounds for their application, but wish emphatically to mark the necessity of insuring appropriateness in the bay which is merely a luxury.

We are all familiar with the commonest of all examples of inappropriate bays—I mean the almost invariable excrescence which decks the speculative villa. But let us be sure, in condemning it, that we condemn it on the right grounds. Ambitious as these features appear, there is generally an economic reason for their existence. Sometimes they are one storey high, sometimes two, and in either case the use of this unlovely addition is generally dictated by one of architecture's fundamental laws—the economy of space—which is the economy of material. The one-storey bay tells the passer-by, not merely that the speculative builder wished to give a spurious gentility to his drawing-room at the expense of the garden, but that, desiring to put on the ground floor a room of larger capacity than that of the floor above, he hit upon the bay as the best expedient. Even where the bay is two floors high, thus belying the reason just given, another cause may be at work. Without the bay there would have been the need of making the wall of the large front room line with the wall containing the front door; in other words, the room would have had to be cramped, or the entrance lobby unduly lengthened. In fact, the common villa bay, so far from being an ambitious luxury only, is generally born of the desire to keep down the cubic contents. So much for its shape, its plan and its capacity; as for its decoration that is another matter. That it is generally stop-chamfered on every stop-chamferable surface, that it has what they call a patera in the middle of every lintel, and that it boasts of columns of the fern-leaved order of Gothic—all these things are to its shame, but they do not disqualify its original title to existence. Some one should write an article, or even a book, on the cost of ugliness. The pathetic squalor of middle-class homes is greatly due, not to the absence of unattainable embellishments, but to the addition of the undesirable. I know a town in a good stone country, inhabited by persons of comparative wealth (for it is the country home of a neighbouring business centre) the architectural appearance of which has been hopelessly ruined by sins not of omission but of commission. I suppose that if, on an average, 10*l.* less had been spent on every one of the houses in that place, it might have been comely, whereas to-day it is loathsome. It bristles with bay windows, of course, and they have nearly all got stone dressings, but there is scarcely a square arris to be found in the town, and not a chamfer but is mutilated with fancy stops. If all these chamfers had been run out to their legitimate terminations, or better still, if half of them had never been at all, if all that square sunk foliage had never been square sunk, if all those paterae (their creators call them "paterasses") had never been cut, the builders might have been richer, the rents might have been lower, and the town itself might have been natural and beautiful, instead of looking like the purgatorial region which lies between the Angel at Islington and the Seven Sisters Road.

Alas ! for the villa bay ; its existence is justified, but its usual development is one of the darkest sins of architectural wantonness.

I have mentioned as one of the legitimate causes of the bay window the desire to obtain an oblique view from the room. To this cause is due the well-known and often gracious feature which one may call "the seaside bay" ; with this we are all familiar, and happily we are able, among the bays of this class, to distinguish a successful as well as a disgraceful variety. The Englishman's cultivation of the seaside dates practically from the last century, and probably the desire on the part of landladies to claim a sea view as an excuse for additional rental is coeval with the birth of watering-places. It is to this excusable rivalry in the possession of a glimpse of salt water that we owe in most marine towns the amiable bellied fronts of the streets which run at right angles to the coast line. Without the use of bay windows a sea view in such streets would be impossible ; with their employment comes the possibility of such a view—a little strained perhaps in the further buildings, but still appreciable, just worth having and just worth paying for. Indeed, so identified in our minds is a street of bay windows with the mental image of a seaside spot that the very look of certain houses suggests the sea as much as do bathing-machines and a smell of tar. There are people who will tell you that they can smell the Channel on the north side of Hyde Park, but it is more a question of eyes than nostrils. It is, in fact, the existence of a row of smiling, sunlit houses planted along one side of a broad street only, and, above all, the prevalence of bay windows, and especially of bay windows in certain transverse streets that cultivates the illusion—one falls irresistibly into the trap. You remember how in "Liberty Hall" the old man says there are more "burials" than "blooms" in Bloomsbury. One might transfer the pun to Bayswater where there are more bays than water, but the former do so connote the latter that they set one at least thinking of sand and waves, though all the time the houses are bowing and bellying and jostling round one another's shoulders for a peep, not at the blue ocean, but at the green trees and grass. Oh, these seaside bows—the real ones, not the Hyde Park ones—how well we know them. The modern varieties are tall and pert, not circular, but octagonal and bastard octagons at that, with one gaunt oak-grained sash in the centre light and two thin and equally tall ones in the side lights. And then the brickwork all covered with pale stucco, and the weak lead roof that lets the wet through. The old ones, how different and how insidiously attractive. As I write I think of one which, on plan, is about a third of a circle ; it is divided into three sashes of equal size, all made circular of course, and between them comes no brickwork but just the sash boxing, so that, in fact, the entire construction is of wood ; on the floor above the running of the front room over the entrance passage made the bay unnecessary for space, but unwilling to give up the lines of the bay, whose delicate curve means so much to the expression of the house, the designer continued the treatment, and added to its emphasis by a light metal roof of similar form, covering a curved balcony with a balustrade of ironwork. A great deal of the charm lies simply in the shallow curve and in the appreciation, however latent, of the slight extravagance of the circular joinery. The cheap or inexpensive building of last century or of the early nineteenth century seems never to have denied itself circular joinery ; but to-day—probably owing to the prevalence of machine-made mouldings—circular work is apparently the first thing one has to give up in the attempt to save money. In the circular sashes one's satisfaction rests not merely in the delicate form of the sweeping segment, but also mentally—and perhaps unconsciously—in a sense of the added labour, in which there is a gleam of Ruskin's lamp of sacrifice. Not that the later nineteenth century knows no extravagances. The householder who shrinks from laying out money on the refinement of a long-radius curve would scorn to be without his stained-glass "kingfisher" in the panels of the front door, and will probably run to tile risers for the steps. Can it, oh, can it be a fact that every age of building finds at last some corresponding period of admiration, and will it ever be the lot of some degraded generation to cherish a cult of to-day's abominations? Will there some day be talk among the as yet unborn of the good old days of our great-grandfathers and their cathedral-tinted door panels, their delicately tiled halls, their winsome stop-chamfers and their charming bay windows, the angle piers of which were formed sometimes of quaint wire-cut bricks, covered with grey cement rendering, and sometimes with dainty cast-iron columns with neck mouldings four times the true Palladian size, and branching capitals cast in the similitude of the common polypody ?

Such a day I hope can never come ; or rather, when the time does come for our great-grandchildren to pass judgment on what is left of the bricks and mortar of to-day, they will have before them such a vision as we cannot have in any of our retrospects. There is in the work of to-day a visible contrast between the good and the bad such as is not to be found by any searcher of our time in the recesses of our past. The contrast-line, unhappily, does not lie between architects' buildings and builders' buildings ; for, to our shame be it spoken, there are things bred on the drawing-board of men with brass plates which have to find themselves classed on the wrong side of the line. But that the contrast exists there can be no doubt, nor can there, happily, be a doubt that there are many beautiful

things—bay windows among them—which will do as happy resting-places for the eyes of our antiquarian descendants.

But we are getting away from the bays, which, to do them justice, set one thinking and drive one's thoughts afield. In bays of the circular form—and, indeed, in polygonal ones as well, but perhaps specially in the former—it is important to remember, as a designer, that the plan form, whichever is adopted, is the most important thing about them; that it must be cherished and led up to, and that finally it will accomplish more of its mere self than a person of moderate experience would expect. Perhaps it seems unnecessary to say this, but there is a special reason for emphasising the observation. In the actual process of designing we deal necessarily with orthographic elevations as a means to our end. A bay window put on to an elevation is a comparatively dull thing. You, as architects, realise its circularity on your own or other men's drawings, especially on your own, by the toil of drawing in the mullions in oblique elevation. But the drawing does not tell its full tale of effect, and you may be tempted to attach an (apparently lacking) interest to the member by some addition to the simplicity of its lines—some crowning feature, for example, or an addition to the centre of the cornice, if there is one. In this there is danger of error. The circular or segmental plan once adopted, you cannot serve its end better than by the accentuation of the horizontal lines which partake of the circularity. Herein lies the difference, or one of the main differences, between those old bays that we admire (be they stone and Tudor or wood and Georgian) and the modern horrors in which hang the "apartment" labels. The modern bay makes for height in its apertures; it avoids bars, specially horizontal bars, in its glazing; transomes are probably altogether absent, and the piers are made thick and heavy so as to break even the moderate continuity of the sashes meeting rails and of the heads and sills. With the older types this is different. Copious window bars (or in stone-work well defined transomes) perform the double office of breaking up undue verticality and of emphasising the plan form of the bay, while the small piers, mullions or sash boxes only produce as much intermission as the eye (that unconscious arbiter of stability) demands as a guarantee of sound construction and as a preventive of the worst of all faults—the over-bowing lintel. If you do not know what I mean by this last, ride down Oxford Street on a 'bustop and look at the excrescence which is the sole feature of the Frascati restaurant. To design a bay of this description you take a centre on the frontage line of the building (or a little outside it if you prefer to increase the effect), and turn a wall circle the inner radius of which is only about three times the length of the thickness of the wall. Here you have produced on plan a semicircular bay which you proceed to embellish by the insertion of one mullion. To be sure, the omission of mullions altogether would have made the thing more startling, but the one mullion gives the public enough to reflect about with some sadness. As they pass the building they naturally and generally view it obliquely; the eye glancing across the curve which looked so fair on plan, and at least respectable on elevation, takes a straight line from the edge of the single mullion to the jamb, and above it they see transome and head vaunting their unsupported circularity.

This sad example leads to what one may call an axiom of all good circular work, that the vertical supports must always be sufficiently close together to prevent the appearance of the horizontal members being unsupported. This rule is in one sense the counterbalance of what I mentioned before—the need of emphasising the horizontal members; but it is surprising how little, how slender the vertical supports may be and yet satisfy the eye in this matter. In the old inn windows of many a coaching hostel the slimmest glazing bars between the glass panes are enough to prevent the eye being troubled by any optical instability. In the splendid segmental or semicircular bays, which are the glory of some of the country houses of our English Renaissance, the mullions are always so placed that there is no chance of offence in this respect. It should be borne in mind that the relative closeness of these vertical supports is necessitated and regulated, not by the measurement of the length of segment, but by the length of its radius. The flatter the bay, in other words, the less need for the frequent support.

It will readily be understood that the greatest importance attaches to the way in which a bay is covered in. Obviously a bay, like other structures, can be roofed in either of two ways—either with a flat roof or a sloping one. If your bay extends upwards to the whole height of the building its roof may possibly form a part of the general roofing of the house. This, which is often a successful treatment, needs handling with great caution, especially if the bay be large and the building comparatively small. In a very large structure the roof of the bay, whether polygonal or circular, can appropriately be formed as a member growing out of the rest of the roofing; or it may even, if the plan of the bay be part of a regular polygon, or of a circle, take form as a turret, and rise above the apex of the normal roofing. It is, however, very often the lot of a bay window to be the largest feature, or one of the largest features, of a comparatively small house, and in such a case the use of a high-pitched roof of such wide span, with eaves at the level of the general eaves, will often result in the production of a feature whose size will swamp not only the building, but with it the bay itself. It may easily happen that the architect finds himself driven to the use of a flat invisible roof for his bay for this very reason, that any form of sloping roof would work itself out into something too gigantic for the scale of his building.

There is one treatment, popular some few years ago, which I think we may unhesitatingly condemn as inappropriate in nearly all cases. It abounds in the neighbourhood of Fitzjohns Avenue, and consists in the cheerful expedient of clapping a gable of the full width of the bay on to the unfortunate erection, which is placed in the difficulty of reconciling its own polygonal form with the square structure which surmounts it. The problem is usually resolved by one or two expedients. Either the canted angles of the bay are treated as gigantic chamfers and brought to the square by the usual latter-day expedient of a vast stop, or corbelling, or the gable, which is at times half timbered, gets its triangular soffits supported by a bracket. These expedients, particularly the bracket business, are unhappy at best, for they cast a shadow on to the splayed windows, besides offering gratuitous harbourage to sparrows and their nests. If a bay must be surmounted by a gable, there are ways of getting over the difficulty. One may make the bay itself square and so produce one of the most beautiful features that can be devised. Indeed, so successful is the appearance of the square bay under a gable that where this form is used one can tolerate a greater width in the gable, and a resultant soffit on either side, though the triangular soffit left by the polygonal bay is so far from tolerable. All good rules have their exceptions, I suppose, and there are buildings of bygone days which successfully carry through even the problem of the square gable on the canted bay. You may see an example in the Talbot Inn at Oundle, of which I have provided a sketch. The homely satisfaction of this building goes to prove that our forefathers could sometimes succeed where their descendants generally fail.

On the whole, one of the most beautiful treatments, though a very unusual treatment, of a gabled bay of polygonal form is that of which one finds an example at Weston, an old house between Leeds and Ilkley. In this case the front or flat wall of the bay runs up to form the gable face, and the splayed sides are surmounted by parapetted wings with finials. The wings having horizontal copings do not, of course, exactly follow the line of the roof. Viewed from the back, if one could so view them, they would present the appearance of triangular blanks, but there is no great harm in this, nor indeed would there be any harm in their following the roof line. A gable formed on a canted plan is often very successful, as those will agree who know the gabled apse of St. Michael's Church at Folkestone, where the gable is like this at Weston, so to speak, three-sided.

In cases where the bay we are dealing with has walls which are lower than the main walls of the building the roofing difficulty is often nearly as great, at least, where pitched roofing is attempted, and the difficulties in this case are caused by the intersection of the bay roof with the vertical face of the main wall behind. It is obvious that the roof of a segmental bay, if projected at an oblique angle on to the main wall, produces nothing more or less than one of those eccentric outlines which the geometricians know as conic sections. With a polygon—if it be (as it generally is not) the exact half of a regular figure—there is no great difficulty, as the centre of the figure will lie on the wall line, and the roof can be brought up to a true apex with regular mitres on the hips. When the figure formed by the plan of the bay is something less than the half of a regular polygon a little cooking is sometimes indulged in, with results which are elegant on the elevations but disastrous in the eyes of ordinary spectators, who cannot be induced to see things as they would appear on a drawing-board.

Generally speaking canted bays are not parts of regular octagons, but have their canted sides less than the front. In such a case there may be a small piece of straight return between the cant and the wall. It then becomes necessary to regulate matters so that the hips of the canted sides shall exactly meet on the wall-line, otherwise a roof is produced which nothing but cooking can save, and which the said cooking will generally shipwreck.

In this connection it is well to observe that many of the best old examples, particularly in Tudor and Renaissance work, have no square returns at all, and further that the angle of the cant is frequently flatter than 45 deg. There is, to be sure, an objection to the practice of allowing a very flat cant to die into a wall face without the intervention of a square return, namely, that the mouldings of the bay become unduly developed in their incidence upon the wall. This difficulty has to be met either by extreme modesty on the part of the mouldings, which have, in fact, to moderate their projection, or by continuing the same mouldings on the wall face as strings or cornices.

On the whole, there is a good deal to be said against pitched

roofs for bays of the lower description, unless it be in the case of those with roofs of weathered masonry. In these, it need hardly be pointed out, the planning must be done in strict regard to the form which will be brought about by the intersection of the roof slope with the back wall.

There is one simple consideration which often altogether upsets the possibility of applying a sloping roof to a bay, namely, the height which such a slope occupies upon the wall-space. If your bay projects 3 feet, it is obvious that with a slope of anything over 45 deg., a pitched roof with its flashings will make a window for the room above almost an impossibility unless its sill be at an unusual height from the floor.

The corbelled windows, to which we generally and perhaps incorrectly apply the term "oriel," are frequently covered with high-pitched roofs of masonry, but with this exception the bays of Mediæval, Renaissance and Georgian architecture, in fact, all the best bays of our ancient periods are covered with flat roofs, or with roofs so flat as to be invisible behind their parapets.

The roof in these cases being of no account architecturally it remains to be considered how the parapet is dealt with. Some of the best examples in this, as in other departments of architecture, are the quietest. I noticed the other day, in a remote East Coast village, a plain brick house, whose only challenge for attention was a front door and two bays. The bays were canted and very flat, and they extended to the whole height of the wall, in fact, their coping, a 3-inch York stone, was level with and identical with that of the main house wall. Our modern Georgians would have put a ball at each of the angles, and the balls would have looked very well, too. I should not blame them. The composition I am speaking of, simple as it was, did without the balls, and looked as nearly perfect as things of the kind can look.

It was as if a plain brick front, adorned only with its necessary openings and its equally necessary coping had been taken and bent in two places to form the bays which, with the door, were the only ostentations of the house. The roof, of course, ran straight, and the slight projections of the bays were covered by a lead flat, which was little more than an extension of the gutter of the main roof. In these cases we have the simplest treatment, which, however successful, is no argument for the suppression of all more ambitious conceits. Parapets in all ages have been things to play with, and the bay being the luxury-point on a house's front is not the feature to forego all license. Our old friend, the battlement, used even by the ancients as much for ornament as for the defensive objects which its warlike name implies, is a frequent infester of the tops of bay windows. He is not inadmissible, but he should be used with care. Too big he becomes gigantesque and ludicrous, too small he is liliputian and again ludicrous. Even when the proportions are sound he may break up indecently the horizontal continuity which I have spoken of earlier as one of the secrets of success in a bay. Open work of most kinds in the parapet involves piers, and these again, though very valuable in the canted bay as implying strength at the angles, may introduce an ill-placed verticality. Our modern trick of the festooned or swooping outline is sometimes happy but is better employed on the straight-sided bays than in the circular, and the same may be said of finials (balls or other forms) unless they occur with such frequency as shall cause an effect of series so as rather to carry the eye along the line we are emphasising than to interrupt that emphasis.

Where indulgence is taken in open-work parapets or in finials or other means of breaking the outline, it is still possible to maintain the emphasis of plan form by a cornice of some vigour. There is, especially in the circular forms of bay, a marvellous charm in the simple bending of a moulding, however unelaborate, to the selected form. Even a plain unmoulded band, say of stone, among brickwork has its value, and in cases where the bay is not mullioned, but pierced by large sash openings, it is difficult to overestimate the importance of all the horizontal bands in giving continuity to the form. A base will often help—even a simple plinth with the smallest possible projection; just enough to catch the light and continue, so to speak, the message of circularity.

It is time to say something of those bays whose form is not continued downwards to the ground level. The simplest way of treating such a feature is obviously to cut it off flat, and, strange as it may seem, there are many examples of such bays on a small and homely scale and in wooden construction which are singularly successful and happy in effect. The bare idea is contrary to one's notions of propriety, and the bald simplicity is helped in many cases by a slender wooden corbel or cantilever, which makes no pretence of really doing the work; but the fact remains that in many old villages, such as those which happily still surround London, there are small bays of this description with absolutely plain soffits which are not by any means unpleasing in their appearance.

The corbelled-out bay, to which, as I have mentioned before, some authorities restrict the name "oriel," is a more favourite feature in foreign architecture than in our own. If you look through the pages of those two monumental works on the Renaissance, I mean the Denkmähler Deutscher Renaissance and Mr. Gotch's book on our English buildings of the same period, you will be struck by the fact that, whereas bay windows abound in both, the German examples are very largely of the corbelled-out variety, while the English ones are almost invariably of the simple, solid, down-to-the-ground type. Where the Englishman broke loose was in his timber-work; his bays in wood-work are sometimes marvels of projection, but in stone the Briton was ever more modest than his foreign rivals. It may be said to the credit of the English that they have never been over-reaching in the matter of corbels. Visible stability, even in the wildest days of the Early Renaissance, has always been as much reverenced in English architecture as it was ignored elsewhere. There are nations whose natural impetus has led them in architecture to the production of portents. It has been their aim to make stone to look like a lace pocket-handkerchief, or to run it fine with corbels in real buildings as a child sports with gravitation in his box of bricks. These tricks have not been English tricks, and where they grow on English soil they are of foreign planting. We may be known by our bays and bows as by other things, and our solidity is something of a virtue. At the same time one must allow a certain beauty to even the extravagant German frolics. Those bays in particular which grow out of the angles of a building are sometimes of singular grace, and when they are of the square type are often so arranged as to do no violence to the sense of stability.

I had promised not to go into the construction question, but there are one or two points of appearance so closely allied to construction that I cannot conclude without a reference to them. First, as to the bays at the angle of buildings. It is a common fault, and a perfectly avoidable one, to so place a bay at the corner of a room that the carrying of the wall angle above it becomes to inquiring spectators a matter of conscious or unconscious anxiety. Of course one knows there is some jugglery of rolled steel joists going on out of sight, but there is no reason why the unconscious faculty which asks building construction questions on its own account should have been worried at all. It is perfectly easy to so plan a bay, circular, or square, or polygonal, that the normal wall angle shall be either upon or slightly outside the line of the bay. This gives no detriment to the effect within, and is a great relief to the spectator outside. To have anything so cardinal as the angle of a building apparently descending into the untrustworthy embrace of the lead flat over a drawing-room bay is, to well-ordered minds, a sin.

There is also sometimes a sin in the popular collegiate device of a corbelled bay over an entrance archway. It may be all right in appearance, as well as in construction, particularly if the corbelling is not pressed too hard on to the arch. If well arranged the corbel and its burden seem only to be paying a compliment to the stability of the arch, but if once you get anything approaching to a collision between the arch moulds and the corbel the result is measurably weak—at least in looks. If close quarters are essential some form of keystone treatment is the only possible expedient. One may make a Classic or semi-Classic keystone the base of a corbel where it would be impossible, on grounds of appearance, to let a corbel take liberties of trespass with a Gothic arch.

It is time for me to draw these rather rambling remarks to a conclusion, and I feel the lack of any great central doctrine or leading truth with which to pull the subject together. These bays of which we have been speaking grow more in the house than in the palace; indeed, the monumental styles of architecture find less opportunities for their use than the more strictly domestic. The bay has no place in the Palladian method, and though one may find here and there a Classic clubhouse whose smoking-room has an excrescent window claiming the name of bay, you will discover it to be disguised outwardly by some tortured colonnade whose insulted entablature seems to be only waiting for the time when it may be allowed to go back to the straight again. Gothic architecture and the freer Renaissance styles gave the opportunity of using bays even in buildings of size and dignity, but the bay as we have ordinarily to deal with it is the appendage of a house—of a home.

Its importance as part of a design can hardly be exaggerated. It is, if one may use a homely simile, like the nose on a face. Add 10 per cent. to its size, or take a degree from its flexure and you may ruin the countenance—I should say the elevation—to which it belongs.

A young architect not infrequently opens practice by "throwing out a bow" for a relation. The simple manœuvre is thought to be a safe task to entrust to an unrisen genius. Confiding friends! They little know the risks they run. To be sure, the money-hazard is less than that of the cost of a house, but they little understand the test to which they put their aspiring architect. You know Tennyson's poem of the flower in the crannied wall—

> "If I could understand," he says,
> "What you are, root and all, and all in all,
> I should know what man and God is."

The knowledge of the little is a test, a proof, of the knowledge of the great—of all.

So with your bit of a bay window. It isn't any fool's job. There is a task for eye and hand, a task for the senses of proportion and propriety, a task, in fact, for all the powers that go to make an architect even in the least of these trifles. Bays and oriels are not to be despised. If a man can design them it is, perhaps, a sign that he can design most things.

"Throw out your bays" by all means, and if you can do them worthily you are probably capable also of throwing up your town halls and your palaces.

Mr. Leonard Stokes, who proposed a vote of thanks to Mr. Waterhouse, said he was rather annoyed with the sympathy shown in the paper for the jerry builder. The villa bay did not give more floor space, and it seemed useless to apply bays to a row of houses the occupants of which often covered them with curtains. There was a kind of bay — the one in an angle—which might be called a gulf, and he advised all to avoid it, although in the past similar windows had often been successfully placed. Nor was an angle of 45 deg. a happy one. If the student could not design a bay, then perhaps it would be better for him to give up architecture. Simplicity of treatment was to be advocated whenever a bay had to be designed.

Mr. F. T. Baggallay, who seconded the vote, said all architectural and artistic ideas were inclined to relapse into a state of stagnation, and such a paper as they had heard that night was beneficial, as it helped to bring before them new and definite ideas. The question of the derivation of such words as oriel and bay windows was not of great importance, but it would be useful if there was a definite term for such bays as did not go down to the ground. Angular bays were very hard to do well, and resulted often in a disastrous effect on the whole building.

Mr. H. H. Statham said the question of the economy of space by a bay was one which rested chiefly with the client, who generally considered the room more commodious which possessed one. Segmental bays were good and often added a distinction to the house; a pleasing example was to be found in the narrow thoroughfare of Walbrook.

Mr. A. Payne said there were practical reasons why the bay window was used in London, and he thought their use would be even more common in the future. The introduction of the bay was the only way to overcome the difficult problem of frontage. The bay window could be used without encroaching upon the line of frontage, and thus avoiding dispute and the interference of district surveyors.

Mr. Thos. Blashill said he had hoped to hear a precise definition of what differentiated an oriel from a bay window. In cases of litigation which might arise it would have been advantageous to refer to such a definition. Bay windows added a variety to streets which otherwise would not have been obtained, and the builder's bay had many attractions for the small householder. Mr. Stokes, he said, had spoken about simplicity in treatment and proportion. Regarding the existence of the latter, he thought many were undecided. All things considered, the bay window deserved encouragement, more so perhaps when long street frontages had to be dealt with.

Mr. H. A. Satchell pointed out the advantage of bay windows at seaside houses. During the summer heat, when the south blinds would be drawn, a glimpse of the sea (one of the objects for which people went to the seaside) was still to be obtained at the eastern and western sides if the house had its bay window.

Mr. Fellowes Prynne summed up the discussion and put the vote of thanks, which was carried with acclamation.

Mr. Waterhouse briefly replied.

It was announced that the next meeting would be held on December 9, when Mr. Edwin T. Hall would read a paper on the "Position of Architecture among the Arts."

THE GLASGOW ARCHITECTURAL ASSOCIATION.

At a meeting of the Association held in the rooms, 187 Pitt Street, Mr. George S. Hill in the chair, a paper was read by Mr. Hunter Crawford (Edinburgh), entitled "Domestic Steam Heating and Hot-water Supply." Mr. Crawford pointed out and discussed the differences between heating by steam and heating by hot water. The extreme dryness of air caused by steam heating rendered it unhealthy, except where a good circulation of air could be obtained as in a hall or staircase. The rapidity with which the heat in a room could be raised by the steam was certainly one of the advantages possessed by the steam system over the hot-water system. The fact that water could be heated by steam to near boiling-point rendered this system of great use for domestic purposes in the kitchen and in the washing-house, &c. Mr. Crawford illustrated his paper by a finely-executed model, glass tubes being used in the place of iron piping, so that by means of coloured water the flow in the pipes was clearly indicated. Mr. Crawford, by means of the model, showed the several points which had to be borne in mind when putting in such an installation as was shown by the model, which showed a section of a house with radiators fitted into the different rooms, washing-house, boiler, &c., connected to a steam generator in the basement. Mr. MacGibbon, in moving a vote of thanks, which was heartily adopted, to Mr. Hunter Crawford, referred to the pleasure the Association had in receiving him as a delegate from the Edinburgh Architectural Association. The chairman intimated to the meeting the holding of a smoking concert in the rooms on the date mentioned in the syllabus, December 13.

ARCHÆOLOGICAL FORGERIES IN BERLIN.

From a supplement to the *Allgemeine Zeitung* we learn that Professor Furtwängler, who attacked the genuineness of the "Tiara of Saïtophernes" in the Louvre with such persevering valour that no one save, perhaps, on patriotic grounds, now believes in this too notorious diadem, has lately shifted the scene of his operations to Berlin, where, besides a large purchase of forged terra-cottas, a still more evidently counterfeit marble head has lately been acquired. It is a large female head over life-size, coarsely made up to a superficial likeness with the famous archaic priestesses or maidens from the Athenian Acropolis. The blue-veined marble and the obviously artificial nature of the crust of dirt which coats the head, alone show how gravely the present directors of the Berlin collections have allowed themselves to be misled. It would seem, to judge not only from recent purchases but from recent refusals to buy genuine antiques, that even Berlin must have yielded to the popular craze for the "æsthetically satisfying," as distinct from what can be scientifically guaranteed on historical or critical grounds. The scientific world was unprepared for the startling exposure of the new activity on the part of the forgers which Professor Furtwängler laid a few days ago before the Bavarian Academy. As in the case of the tiara, the new head in Berlin is assuredly not the sole product of its workshop. If, as hinted, "there are greater wonders there," the Bavarian Academy will be serving the highest interests of archæology by promptly publishing *in extenso* the opportune and important paper of which only the short *résumé* referred to above lies before the public at present.

GENERAL.

H.R.H. the Prince of Wales, president of the Imperial Institute, has, on the recommendation of the Executive Council, approved of permission being given for the twenty-first Annual Ecclesiastical and Educational Art Exhibition to be held at the Institute concurrently with the meetings of the Church Congress at the Albert Hall in October next. It is proposed to extend the time for which the Art Exhibition is usually open.

Painted Panels which were executed for the Pastoret Mansion, Place de la Concorde, Paris, and ascribed to Fragonard, have been sold by auction for 12,000 francs. In addition to allegorical figures were representations of "The Judgment of Paris," "The Crowning of Pan," "Hercules and Omphale," and "Cupid and Psyche." The mansion has been converted into an Automobile Club.

A Reproduction in bronze of the admired fountain known as "The Gooseman," in the market-place of Nuremberg (executed in the sixteenth or seventeenth century by Lobenwolf), has been lately erected in Fitzwilliam Square, Dublin, by the Commissioners, under the direction of Mr. L. McDonnell, architect.

The Election of a successor in the Académie des Beaux-Arts to the late M. Lenepveu, the painter of the "Joan of Arc" series in *The Architect*, will take place on the 17th inst.

Mr. W. T. Maud, the artist and correspondent to the *Graphic*, will read a paper before the Society of Arts next Wednesday on "Egypt and the Soudan in 1897 and 1898."

Sir A. M. Rendel & Son are to design the bridge which it is proposed shall cross the Nile by the Atbara for the railway to Omdurman. The foundations of the bridge are to be sunk by means of compressed air.

Mr. J. White, an Edinburgh builder, having offered 70,000*l.* for the two remaining plots of ground at the North Bridge—a sum which is 5,000*l.* below the sum originally fixed—the committee have recommended the acceptance of his offer.

The Duke of Cambridge, on Monday, opened a public institute which has been erected in Tooley Street by the united charities of St. Olave's and St. John's, and which consists of a large hall, a reading-room, a gymnasium, a library, a club-room and a billiard-room. In honour of His Royal Highness's visit, Tooley Street was gaily decorated with flags, banners, &c.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

THE Brussels correspondent of the *Morning Post* writes:—I have just had an opportunity of seeing a remarkable mechanical clock which has recently been completed by M. Noll, after five years of uninterrupted work. The clock, which is of enormous size, weighs 4,000 kilogrammes, and the whole of the works have been made by hand. It is built to represent a church, and there are forty-six mechanical figures which go through various evolutions. The clock indicates the seconds, minutes, quarters, hours, days, weeks, months, seasons and the years, together with the movable or fixed feasts for the next 104 years. Every hour the twelve apostles make their appearance, march past and bow before the Saviour, who bestows his benison on them. Among the other mechanical curiosities are the four ages of life, Death with his scythe, a bellringer calling to vespers, six Capuchin monks who enter the church, the seasons, a cockatoo, a shrill-throated cock, a night watchman sounding a trumpet or beating a drum, and the faithful listening to a musical mass. Each of these movements is seen at its appointed time, and the whole of them can be set in motion at any moment without disturbing the machinery of the clock.

Re Typewriters

AFTER you have finished experimenting with so-called cheap Writing Machines, come, as do all men of sound judgment, to

The BEST and MOST RELIABLE Machine on the Market, THE No. 4 Yost.

It is a marvel of Mechanical Genius,
It is constructed of First-class Materials only,
It will last a lifetime, and
It will do more practical work with greater ease than any inferior typewriter, which only attracts consideration by its low price.

CATALOGUES POST FREE.

Machines sent on one Month's Hire or Seven Days' Free Trial

The YOST TYPEWRITER CO., 50 Holborn Viaduct, E.C.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE

The tower of the fine old church of St. Nicholas, Ashill, Norfolk, has been thoroughly restored by Messrs. Waters & Son, of Watton, under the direction of Messrs. Miller & Hall, architects, London. The old parapet has been taken down, and all loose and decayed work removed to a considerable depth. The walls were then levelled out and carried up and finished with battlement top in Ketton stone, with embrasures and quoins neatly filled in with flint-work, the whole being built in cement. There are two fine gargoyles, well carved, placed in line with new string-courses. The stone caps to the buttresses have also been thoroughly restored. The flint-work of the tower has received careful attention, and all loose stones reset and cracks filled in. A new roof of pine has been laid in and covered with sheet lead. The tower is surmounted with a large copper eagle—the crest of the Cotton family—as a weather-vane. The west entrance to the tower possesses a very fine specimen of an ogeed door, neatly worked with a large quantity of members and moulds. The bells, six in number, are to be rehung, and will be refitted entirely with all the latest improvements and appliances. Upwards of 3,000*l.* was spent upon the church by the late rector, and a new reredos and inner porch to the south door have been given by the present rector. The church is now in a good state of preservation, and is a typical village church, containing about 300 sittings, all of carved oak.

EDITH WESTON STONE.

We had a few days since occasion to visit the extensive quarries, or rather mines, which Major Braithwaite has recently opened in close proximity to the famed Ketton Quarries, and found them being worked under the supervision of a competent mining engineer and with the aid of all the most modern labour-saving appliances. The venture is quite a new one, dating only from some eighteen months or two years back when Major Braithwaite, who is an extensive landowner in Rutland, whose property includes the pretty and prosperous village of Edith Weston, whence the quarries derive their name, knowing that the old Ketton quarries were about worked out, and thinking from the lay of some of his land which adjoins the estate on which they are situated that the same strata should underlie it, had the ground opened, and was gratified to find that his expectations were amply realised, and that he had a valuable bed of excellent freestone, some 4 feet in depth, underlying at least 30 acres of his property. Being fortunately untrammelled by pecuniary considerations, and fully recognising the value of his discovery, Major Braithwaite at once set to work to exploit it in the most up-to-date manner, procuring the best modern machinery and appliances, and engaging a competent staff. The result is, so far, eminently gratifying; large quantities of the stone have been got out, and it proves to be of very fine texture and uniform quality, very easy to work when newly quarried, but becoming extremely hard on exposure to the atmosphere. Its colour, too—a warm cream—leaves nothing to desire. Although the enterprise is so young, Major Braithwaite, finds some difficulty in meeting the demand, which, local at first, is rapidly extending to the surrounding counties, and the stone only requires to be widely known to be in general request. It is being exclusively used, *inter alia*, in the erection of the Hospital for Infectious Diseases, Leicester, and the Lincolnshire Banking Company's premises at Nuneaton. As, however, the supply may be said to be unlimited, it is only a question of increased plant, and this is being put down with all expedition, so that orders of any magnitude can be promptly complied with. We may mention that the stone is being largely employed, apart from building, for monumental and ornamental purposes, for which it is eminently adapted, owing to its colour and ease in working, to which we have already referred, and it is a not unimportant point that it can be obtained in blocks of any size up to several tons in weight.

NEW PREMISES, EDMUND STREET, BIRMINGHAM.

NEW CATALOGUE.

Mr. A. E. Thornton, of St. Mary's Street, Manchester, has sent us a copy of his new catalogue of drawing and surveying instruments, photo and tracing materials, &c., which has been considerably enlarged, entirely rewritten and revised, and many of the items in which are reduced in price. It contains particulars of new and original lines in nearly every department of the trade, and gives full details of all innovations and specialties to date. Many improvements in drawing instruments are illustrated, and a large amount of useful information given.

ELECTRIC NOTES.

The Walthamstow Urban Council have applied to the Local Government Board for sanction to borrow 36,490*l.* for purposes of electric lighting. It is intended that there shall be 320 arc lamps, and it is anticipated that the price for the improved illuminant will not exceed that now paid for gas, which is 3*s.* 10*d.* per 1,000 feet.

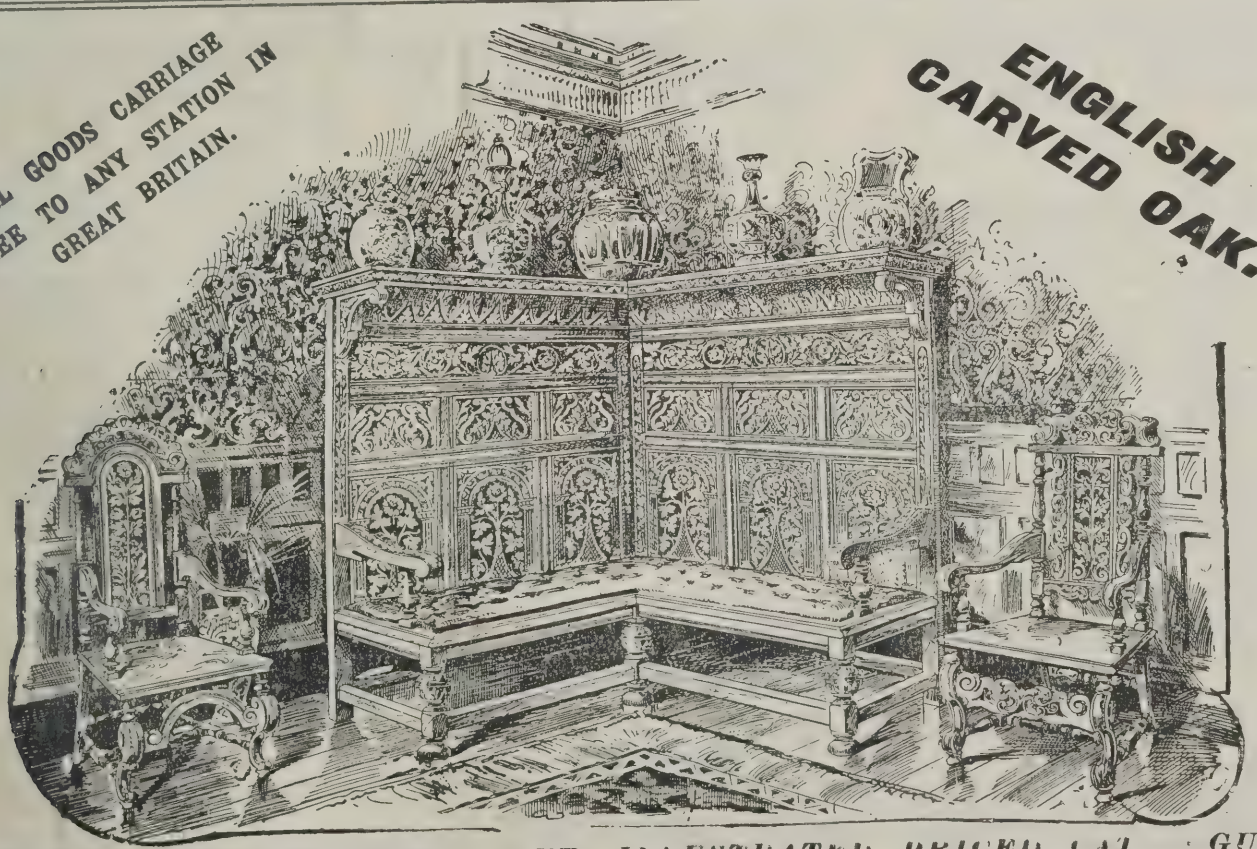
The Teignmouth Urban District Council have decided to obtain a provisional order for electric lighting. Messrs. Taylor & Field, consulting engineers, of Westminster, are advising in the matter.

Telephones are to be placed in the wards of one of the Paris hospitals within reach of the bed-ridden patients, so as to enable them to communicate with their friends outside. There will also be an arrangement whereby the telephones may be switched on to a wire connected with a concert hall, so that the performance may be enjoyed by the invalids.

At a special meeting of the Bolton electricity committee, held on the 24th ult., the proposal to extend the Halliwell Road main into the Smithills district was referred to the chairman and vice-chairman, and it was resolved that an electric main be laid for the purpose of supplying Messrs. Edge and Son's works in Raphael Street. An application for the extension of the electric-lighting system to Lostock Lane and Burnthwaite was deferred until the work for the laying of the feeder mains for the tramways in that district are commenced. The question of putting down mains in Swan Lane was deferred until it is ascertained what the probable number of consumers will be. The tender of Mr. J. Booth for an iron roof at the electricity works was accepted, and Messrs. Musgrave and Sons' tender for the supply of foundation-plates for the two new 1,000 horse-power engines at the works was accepted. The tender of the British Thomson-Houston Company for an extension of the new switch-board at the electricity works was also accepted.

Two companies have just deposited with the authorities plans in regard to the powers which they ask Parliament to grant for exercise in a large area of Lancashire and Cheshire. One of these is the South Lancashire and Cheshire Electricity Company. It is to have one generating station at St. Helens, and the range of its operations will be Bootle, across the Mersey to Hoylake, Chester, round by Davenham, Tatton Hall, Altrincham, Eccles, Bolton, Wheelton, Farington, Much Hoole, Southport and by coast to Bootle. The other undertaking is called the Lancashire Electric Power Company, and it proposes to take a circuit including Liverpool, Southport, Preston, Burnley, Rochdale, Oldham, Stalybridge, Macclesfield, Knutsford, Northwich, Helsby, Neston, Hoylake, New Brighton by coast to Widnes and Liverpool. The generating stations are to be at Wigan, Earlestown, Radcliffe (near Bolton), and Salford.

BUILDING AND BUILDERS.



At last week's meeting of the Campbeltown Town Council it was agreed to apply to the Local Government Board for sanction to erect an additional hospital at a cost of about 500*l.*

A new parsonage is being provided for the parish of Carnforth. A site has been secured at a cost of 160*l.*, and it is estimated that the house will cost at least 1,600*l.*

It leaked out during the hearing of a case of disorderly conduct against brickyard labourers at Peterborough police court that the men engaged in the local brick trade were in the habit of subscribing to a fund out of which any fines for offences against the law were paid.

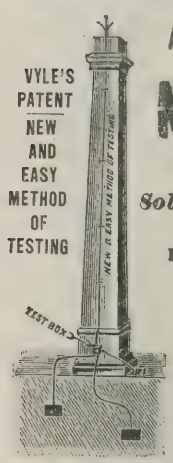
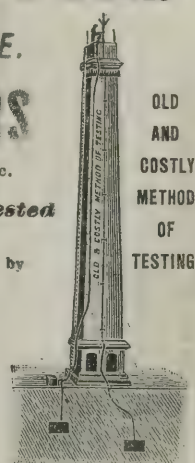
The Victoria Pier and Pavilion Company have accepted the tender of the Widnes Iron Company, amounting to 40,000*l.*, for the construction of the proposed pier and pavilion at Colwyn Bay.

A movement is on foot to erect at Preston a hall and commodious buildings as a memorial to Mr. Joseph Livesey, leader of the temperance cause there. A favourable site has already been secured, and it is anticipated that the cost will be not less than 8,000*l.*

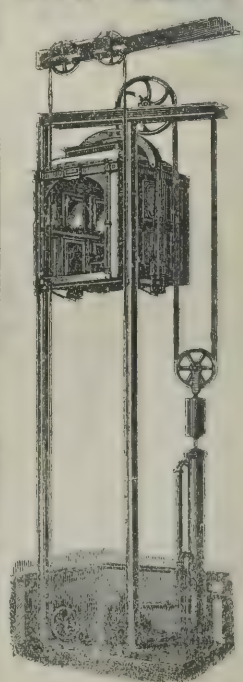


A man employed as a painter by Messrs. R. Neill & Sons was admitted to the Manchester Royal Infirmary suffering from severe injuries to the head. He was engaged in painting the outside of the parcels post office in Morton Street, Strangeways, when the scaffold on which he was standing collapsed and he fell to the ground.



The memorial-stone of the Baptist church which is being erected at the south corner of Dewar Street and Woodhead Street, Dunfermline, for the new Baptist congregation was formally laid on Saturday afternoon. The new church is being erected from plans prepared by Mr. Andrew Scobie, architect, Dunfermline. The building will be seated for between 500 and 600 persons. The Gothic style of architecture has been adopted. The building is planned in such a way that side and end galleries can be conveniently erected when these are required. The main entrance will be from Woodhead Street, and the pulpit and baptistery are to be situated at the west end of the building. There will be a vestry and two retiring-rooms at the back. The retiring-rooms are to be divided by a sliding partition, so that they can be converted into one large room for the use of the Bible class or Sunday school. The church is to be heated by hot-water pipes on the low-pressure system. The building is estimated to cost about 2,000*l.*

A special meeting of the Colchester Town Council was held on Wednesday, the mayor, Alderman E. J. Sanders, presiding. The new town hall committee reported that the original estimate for the erection of the new town hall was 32,000*l.*, with another 1,000*l.* for fittings, making a total of 33,000*l.* The lowest tender for the erection of the building in Bath stone was within this amount, being 30,890*l.* The architect (Mr. Belcher) had, however, always hoped to have the façades executed in Portland stone, in which case the lowest tender was 34,214*l.*, being only 1,214*l.* above his original estimate. This excess was practically due to the general rise in prices for labour and materials. The additional cost of the building, if carried out in Portland stone, would be 3,324*l.*, and Mr. Belcher strongly urged the advisability of spending this additional amount. In consequence of the hope that some generous benefactor might offer a marble hall and staircase, a sum of 5,000*l.* had been placed in the bill of quantities for the information and guidance of the contractors, although such decorative work did not come within the scope of the design to be carried out. As no offer had been made, it would be necessary to add about 750*l.* to the contract prices, for the provision of details for an ordinary stone staircase. The committee had resolved that the Council be recommended to accept the lowest tender—that of Messrs. Kerridge & Shaw, of Cambridge—for the execution of the work in Portland stone, at an extra cost of 3,324*l.*, making a total of 34,214*l.* The report was carried unanimously.



A new model lodging-house is in course of erection at the corner of Bruce Street and Chapel Street, Dunfermline. Advantage has been taken of the fall on the site towards Bruce Street to have a roomy basement, facing that street, containing washing-houses for the establishment and for the lodgers, repairing-room, &c. Two hot-air radial drying-houses are provided with steel-clad stove and all the usual conveniences. The main floor is at the level of Chapel Street, where is situated the women's entrance—the men entering from Bruce Street. Arrangements have been made for the accommodation of both men and women, but the sexes will be kept entirely separate. This has necessitated the planning of the administration department along the centre line of the building, so as to work both sides with one staff and yet give no intercommunication except for the staff. On the main floor there are superintendent's office and staff scullery, kitchens and sitting-rooms for men and for women, and the necessary lavatory accommodation. The hot-plates are in a projecting chamber, with opening sky-lights to carry off the fumes. From this floor starts the double staircase, giving access to the other floors. On the first floor are dormitories for men and for women, and the superintendent's dwelling-house, with direct communication to main building, for the purpose of supervision. The second and third floors are occupied entirely by dormitories, with lavatory arrangements on every main landing. Accommodation will be provided meantime for 141 adults and a fair proportion of children; but, if necessity should arise, about 200 persons could be lodged without making any structural alterations, the directors having considered it expedient to provide an excess of cubic air space over what is required by law. Hot and cold water will be intro-

duced throughout, including a fire service, the hot water being provided by copper boilers in the hot plates. The building will be warmed by open fires in sitting-rooms, and elsewhere by low-pressure hot water from a boiler placed in the basement. The materials and workmanship will be substantial throughout, and it is the intention of the directors to make the new lodging-house up to date in every respect. Mr. Harbourne Maclennan, of Dunfermline, is the architect.

TRADE NOTES.

WE are glad to learn that Mr. Samuel Saunders, the well-known heating and ventilating engineer, of Upper Moss Lane, Manchester, has taken into partnership his late manager, Mr. Christopher W. Taylor. The business will in future be carried on under the style of Saunders & Taylor, Limited.

THE Bower schools, Norton, Malton, are being warmed and ventilated by means of Shorland's patent Manchester grates.

A LARGE clock has been erected in Wilshamstead Church, Bedford, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It has a 5-feet dial, facing eastwards, and strikes the hours.

WE hear that Messrs. W. Scupham & Sons, Limited, of Leeds, have just been appointed agents in the North of England for a large firm of Austrian manufacturers of bentwood furniture.

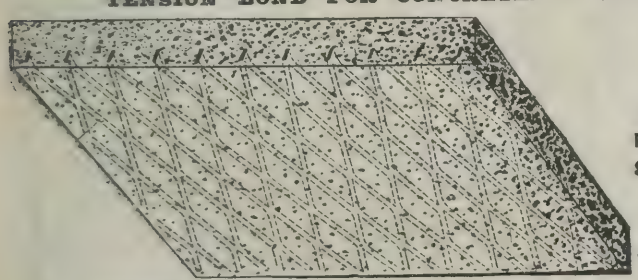
A THREE-LIGHT east window has just been placed in Rhodes parish church, near Middleton, Lancashire. The subject is the "Baptism of our Lord by St. John the Baptist," which is placed in the centre, and the side openings are filled with life-sized figures of Elijah and St. Philip. The figures are standing on bases, and are surmounted by canopies of Gothic treatment. The work has been designed and carried out by Messrs. Cundiff & Pointer, of Manchester. This is the second window this firm has executed for the same church, the other being a two-light window, subject, St. Paul and Melchizedek, representing the Old and New Testaments.

MESSRS. THORPE & SALTER, engineers and contractors, of Red Lion Street, E.C., have just introduced a novel little gas-engine which is known as the "Ruby, a perfect little gem." It is only a small thing which does a surprising amount of work. One of these engines was shown at the recent Brewers' Exhibition, connected to a small centrifugal pump, and attracted a considerable amount of attention, pumping water at the rate of 600 gallons per hour with a 4-feet lift and three-quarter delivery. There is no difficulty in starting the engine, and once started it will run for hours with little or no attention. The amount of trouble and patience required in starting and running small gas-engines has hitherto been a drawback. This is, however, entirely overcome in the "Ruby." The engine is well made to stand hard wear, works on the "Otto" cycle principle with tube ignition, and should be useful for all purposes where a small reliable motor is required at a low cost. The gas consumption works out about ½*d.* per day of ten hours. One of the features of the engine is a neat form of inertia governor, very sensitive in action, and adjustable while the engine is running.

VARIETIES.

THE new theatre which has been erected at Luton at a cost of 19,000*l.*, will be opened on Monday, December 12.

THE Northwich Rural Council have approved of resolutions adopted by the Northwich Urban Council as to a joint scheme for the sewerage of Castle Northwich. The scheme will cost some 30,000*l.*



THE next ordinary meeting of the Society of Engineers will be held at the Royal United Service Institution, Whitehall, on Monday, December 5, when a paper will be read on "Bacterial Treatment of Sewage," by Mr. George Thudichum, F.C.S.

OWING to the dilapidated condition of the parish church at South Whitam, Lincolnshire, the Bishop of Lincoln has consented to its being closed, and has issued a license enabling the rector to use the new parish-room as a temporary church.

A NEW Primitive Methodist chapel was opened at Lazonby on the 24th ult. It is built of red and white Lazonby stone and in the Gothic style of architecture. It has a tower at the west end in which is the staircase leading to the gallery. The part under the gallery has been so arranged that it can be partitioned from the chapel to serve as a Sunday school, and is capable of accommodating about fifty children. Altogether the chapel has sittings for 200 persons. The benches are of pitch pine and the pulpit of carved oak. The total cost is about 327*l.*

SIR JOHN T. BRUNNER, Bart., M.P., has recently presented to Essex Church, Kensington, a handsome organ case, designed

PRICE LIST AND ESTIMATES ON APPLICATION.

by Mr. Howard Chatfeild Clarke, in the style of the fourteenth-century screen work, and carried out in oak left in its natural colour. The organ is placed in the south-east angle of south aisle, and shows on two sides to the church, which are divided into bays with open and cusped arcading surmounted with a carved cornice. This forms the main stage of the organ case, all the spaces being filled in with burnished metal speaking pipes. The upper portion above cornice is arranged into gables with traceried panels and corbelled portions carrying a further tier of speaking pipes, and finishing in panelled pinnacles and crockets, the whole forming a pleasing feature to the interior of the church.

THE small town of Perosa Argentina, situated about thirty miles from Turin, was on the 27th ult. the scene of a terrible disaster. Several bishops and other Church dignitaries had assembled in the town for the purpose of taking part in the ceremonial opening of a new college. The main part of the inauguration ceremonies was arranged to take place in the great hall of the college, and here the bishops and a number of priests and distinguished laymen had assembled, when, without the slightest warning, the hall collapsed and fell upon those gathered within. A large number of persons were injured and several, it is feared, were killed outright. Amongst the more seriously injured were three bishops, and one of these prelates has since died.

WITH a view to ascertaining what assistance the North British Railway Company would give in the providing of proper harbour accommodation at Kirkcaldy, a deputation from Kirkcaldy Town Council waited upon Mr. Conacher, manager of the railway company. The deputation reported that the people of Kirkcaldy would almost unanimously support a harbour if it could be provided with a guarantee not exceeding 6*d.* per 1*l.* on the rates. They explained that the valuation of the burgh was increasing very rapidly, and although one penny would at present only yield a little over 500*l.*, a proper harbour would cause an enormous increase in the valuation. Mr. Conacher asked to be supplied with a return showing the valuation of Kirkcaldy for the past ten years, which would enable him to judge of the increase. It was understood that the selection of the site of the harbour was to be left entirely in the hands of competent engineers to judge which would be most suitable.

A NEW theatre, to be known as The Queen's, is in course of erection in Leeds, and is to be ready for opening on Boxing night. The site is an advantageous one, occupying a prominent corner position at the junction of Meadow Road and Jack Lane. It is quasi-triangular, the apex being semi-circular. A handsome dome surmounts the whole. The position has enabled the architect to provide a system of exits of the most convenient and elaborate description. The house will accommodate some 3,500 people, and the pit and gallery are constructed to seat 1,500 each. The grand circle is divided nto two differently priced sections, and orchestra stalls and pit stalls are provided in front of the spacious pit. There are half a dozen boxes, three on each side of the house. The Queen's has been constructed on the cantilever principle, which does away entirely with pillars and posts, and the view to be obtained of the stage from any part of the house will be uninterrupted. Electric light is being installed in addition to a gas supply, and the ventilation of the house will be found in every respect satisfactory. Gold will be the predominating feature of the internal decorations. The stage is of considerable dimensions, both in depth and width, and will be more than adequate to deal with any of the pieces that may chance to offer. Sixteen well-lighted and well-ventilated dressing-rooms are provided. With the exception of a couple of shops, which have been included in the scheme, the whole of the site is occupied by the theatre.

AT a meeting of the restoration committee held at the Town Hall, Stratford, the Rev. G. Arbuthnot, vicar, presiding, it was reported that upon the work already carried out, including the cost of the new oak benches in the aisles, there was a deficiency of nearly 1,800*l.* A fresh appeal was being made with the object of paying this off, towards which Sir Arthur Hodgson had subscribed an additional 100*l.* The Chairman said Dr. Nason, Sir Arthur and himself had become guarantors at the bank for an over-draft of 500*l.* to enable some of the accounts to be paid, and he (the vicar) had now arranged for the new seats to be paid for forthwith, as he would make himself responsible for the amount (544*l.*) until such time as funds were subscribed for the purpose. A discussion took place as to the payment of other accounts, when Mr. A. D. Flower undertook to become guarantor for another 500*l.* at the bank, so as to discharge the same.

AT Messrs. Armitage's quarries at Robin Hood, between Leeds and Wakefield, a terrible accident took place on Tuesday. Five men were quarrying an immense block of stone, weighing perhaps 200 tons, when the stone slipped and the men fell 25 feet to the bottom of the quarry. The rock then broke, and a

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.

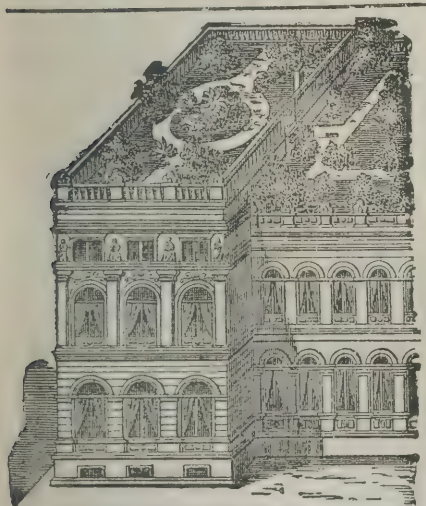
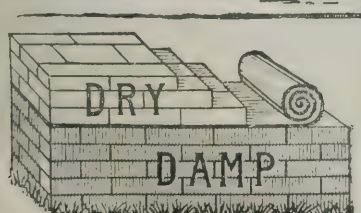
large fragment of about 20 tons fell off on to the men below. Its fall was slightly broken, but was not prevented. George Brown, aged fifty-two, of Clayton's Fold, East Ardsley, was killed before his body could be extricated. Oney Endersby, aged forty-five, of Lawns, near East Ardsley, was found with both legs fractured, and he expired with only time enough to say, "I'm done for." Richard Priestley (34) and Ben Rhodes, of Brighouse, sustained serious injuries. Rhodes, who had a cut on his head, was removed to his own home; and Priestley, who sustained a severe shock to the system, was conveyed to the Clayton Hospital.



THE new buildings of the Brighton, Hove and Sussex Throat and Ear Hospital, a large and lofty square block on Church Hill, immediately north of the parish church, and having a clear outlook over the town and the sea, were opened on Wednesday by the Duke of Norfolk. The cost has been about 6,000*l.* After the chairman of the hospital committee (Mr. G. de Paris) had sketched the history of the institution, which began in a small way in 1878, the Duke of Norfolk highly commended the work done in the hospital, mentioning that the average yearly number of out-patients treated during the past twenty years had been between 900 and 1,000, and that the number of in-patients had also been very large. A little girl who had been treated in the institution afterwards put in the Duke's hand a purse of nearly twenty guineas subscribed towards the funds by patients. Two other very small children handed him respectively a bunch of flowers and a list of the contributors of the purse. After the ceremony of opening the Duke was entertained at luncheon in the Royal Pavilion. Contributions to the hospital, given or promised as a direct outcome of the opening ceremony, amounted to considerably over 300*l.*



THE parish church of Mettingham, near Bungay, was reopened last week by the Right Rev. the Lord Bishop of Norwich. The church has been restored by the vicar, the Rev. W. Boyce, who is head-master of the Grammar School at Bungay, two miles distant, and the cost has been, says the *Nottingham Guardian*, about 600*l.* New seats have replaced the old pews, whitewash has disappeared from the walls, in two places disclosing colour, one of these upon the south wall showing a large nimbus with cross rays, the other beside the north porch exhibiting portions of three figures, the centre one holding a naked sword. Three very pretty piscinæ have been uncovered, and a skeleton found under the stone slab of what has every appearance of being the founder's tomb, has been covered up again where it was. The round tower at the west end of the church is strongly banded with iron as a protection against a tendency to bulge, and the Gothic tracery of the windows has been carefully restored. Curtains adorn the east end; the retable has brass cross and candlesticks. The font is a mutilated specimen of a type very usual in the district: an octagon with alternate lions and angels bearing a plain shield upon the faces, cut in bold relief and standing upon a stem ornamented with four hairy animals, like dogs. The tower has a peal of bells. There is a very good Norman arch with zigzag mouldings at the north door of the nave of the church. This door was for the exit of the funeral procession, which entered by the porch on the south side; it is usual in East Anglian churches, and is frequently ornamented, but there are not many specimens remaining in as good preservation as that at Mettingham. Service has been held during the work of restoration in a spacious barn adjoining Mettingham Hall. Mettingham Hall must not be confused with Mettingham Castle, which is a very handsome ruin in excellent preservation. It was in its day an enormous piece of work; the fine gateway of stone is still standing, and a great quadrangular tower. It stands overlooking the lovely valley of the Waveney river, two miles from Bungay and four from Beccles. John de Norwich obtained leave in the reign of King Edward III. to convert his house into a castle, and there he founded a college for women, and it was dedicated to the Blessed Virgin. The glaring brick house which has been built on the site is still called the college, but it does not harmonise with the surrounding sober, solid stone ruins. Few ornaments of the Plantagenet times in East Anglia can vie with Mettingham Castle in interest and picturesque beauty.

CORONET THEATRE, NOTTING HILL.

THE number of suburban theatres round London has been increased by the erection of one at Notting Hill Gate, after the plans of Mr. W. R. G. Sprague. It was opened on November 28. The building, which is faced with Monk's Park stone, is in the Italian Renaissance style and occupies a capital site, being noticeable owing to the height of the hill upon which it stands from a great distance. The interior is in cream and gold. The decorations and furnishing are carried out by Messrs. Waring in excellent style. The sanitary arrangements were entrusted to Mr. Twyford. The electric lighting is by Mr. Sax Latter, the gas work by Messrs. Vaughan & Brown,

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

the heating arrangements executed by Messrs. Strode, hydrants and fireproof curtain by Messrs. Merryweather. The builder is Mr. Walter Wallis, of Balham, who recently erected theatres at Kennington, Balham, Deptford and Rotherhithe, or enough to make a specialty of such work. Mr. F. J. Thomas acted as clerk of works.

SURVEYORS' FEES.

The case Clarkson *v.* Grout, which was tried before the Lord Chief Justice on Monday, is interesting, as it deals with surveyors and solicitors' costs. The original was an action of ejection to recover possession of thirty-nine houses held by four different leases. At the hearing the Lord Chief Justice instructed Professor Banister Fletcher to make a report to the court. This report showed that dilapidations existed to the extent of 198*l.* 12*s.* 3*d.*, and that work had been done since the issue of the writ to the amount of 117*l.* 16*s.* 9*d.*

The case had stood over to enable the defendants to execute repairs according to a schedule to be prepared by Professor Banister Fletcher. The works had now been done, and he had so reported to the court. The question was, upon what terms the relief should be granted? Defendant's counsel, Mr. Dickens, Q.C., argued against the claim of 107*l.* for surveyors and solicitors' charges, and contended if any costs were to be allowed, much less should be. He based the excessiveness of the charges on the fact that Professor Banister Fletcher, who had prepared the schedule, superintended the work and made reports to the court, had only charged forty guineas. Mr. De Witt, Q.C., having replied, his lordship remarked that probably he would not have so much work to do, but his low charge was much to his credit. In his judgment he allowed 2*l.* 2*s.* a house for surveyor and solicitors, but only the cost of one writ, not four, and in addition, the defendant to pay Professor Banister Fletcher's fees.

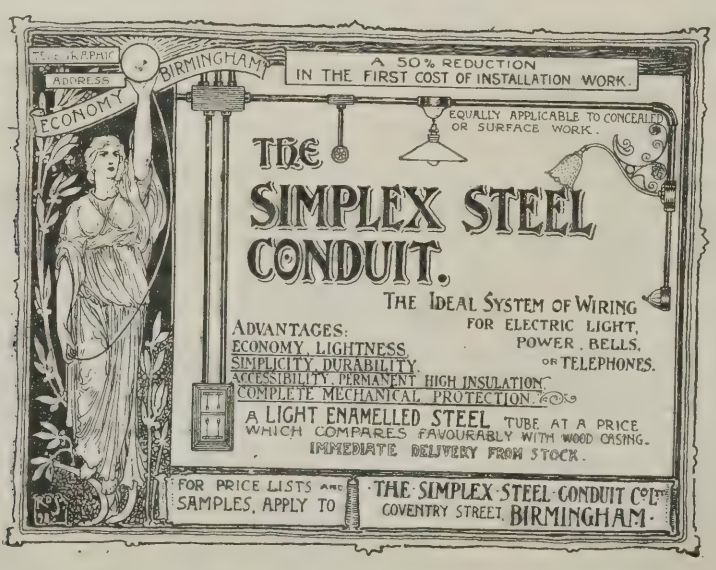
ST. STEPHEN'S NATIONAL SCHOOLS, WESTBOURNE PARK.

The Bishop of London, in the presence of the vice-president of the Committee of Council on Education, the Right Hon. Sir John Eldon Gorst, M.P., Q.C., opened on Thursday, November 17, the completed National schools of St. Stephen's, Westbourne Park. The opening of the newer portion of these schools took place on October 30, 1897.

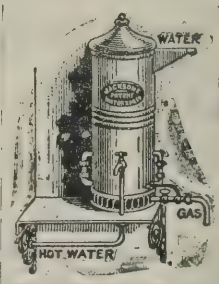
The work of completion has consisted in carrying over the old building (erected in 1858) a new storey of a similar character to that of the newer portion of the schools built in 1896-97, and of some considerable alterations of the older structure necessary for the working together of the old and new schools.

In carrying up the new storey only the external walls of the old structure have been raised, forming an L shaped boys' schoolroom, 56 feet by 20 feet in the long arm, and 48 feet by 24 feet in the short arm of the L, by about 17 feet to the collar of the semi-open timbered roof. The internal walls of the old first floor below are replaced in this second floor by folding screens, so that besides forming one large room the new floor area is also divisible into three classrooms with a wide corridor.

The interior of this room is finished with stock brickwork and stone-mullioned windows; the timber trusses and half-timber filling above the screens are all left the natural colour of the wood, while the plaster is finished with the wood float.



The floor is laid with wood blocks on a steel and concrete floor covering the old building.



A coal lift has been constructed from the old basement up to the new storey, the well being utilised for the electric mains.

The necessary alterations of the old building below have included the shifting of the chimney-breasts and fireplaces to the opposite wall (new breasts being built up from the bottom), the cutting through of a new window for the ground floor schoolroom, and the opening up of a large arch connecting this and another room together so as to form a hall for parochial purposes; to which end new entrances have also been made with doors opening outwards. The roof of one of the two rooms thus united has been stripped, boarded, felted and reslated, while the interior has been decorated in colour.

Externally the old masonry (being badly decayed) has been restored by Messrs. Dreyfus with their patent cement, the old closed area along the front has been opened up, and the railings of the newer portion completed for the whole length of the frontage. One of the two old entrances upon the street has been built up, while the other, the infants' entrance, has been opened out and fitted with a wrought-iron gate with grille over. The passage here leading through to the playgrounds has been vaulted in concrete as well as the open logia, in which it terminates towards the south.

Other works, in connection with strengthening the walls and

floors, have also been undertaken, so that a considerable share of the money now expended (about 2,700*l.*) has been devoted to this part of the work. The total cost of the whole building has been 7,000*l.*, exclusive of the cost of the site, architect's fees and other expenses, the whole scheme having cost about 10,750*l.*

The work from first to last has been very well carried out by Messrs. Rudd & Son, of Grantham (general foreman, Mr. Plenning; foreman of bricklayers, Mr. Bennett). There has been no clerk of works employed, the work being under the direct supervision of the architect.

The other firms employed have been:—

For Masonry.—The Bath Stone firms; imperial green slating, Roberts, Adlard & Co.; wood-block flooring, Turpin & Co.; folding screens to architect's design, Peace & Norquay; coal lift, Waygood & Co. Architect, Arthur T. Bolton, A.R.I.B.A., 2 The Sanctuary, S.W. Surveyors, Messrs. Widnell & Trollope.

NATIONAL REGISTRATION OF PLUMBERS.

The Edinburgh and East of Scotland district of the National Registration of Plumbers opened their session on the 24th ult. in Dowell's Rooms, George Street, Edinburgh (Professor Crum Brown presiding), when the inaugural lecture was delivered by Professor Hunter Stewart, D.Sc., M.B., professor of public health in Edinburgh University, who took for his subject "The Relation of Plumbers' Work to Sanitation." At the outset Professor Stewart drew attention to the danger to public health caused by the insanitary arrangements which prevailed in many houses. The dangers arising from defective plumbing-work were so very obscure that they did not attract the same attention as other perils which were more conspicuous. To his mind the chief province of the plumbing trade was to see that the water is delivered to the community as pure as when it left the main. The lecturer also referred at some length to the question of sewage, comparing the water system of carriage which prevails to-day with the more antiquated methods. He then proceeded to deal with the various micro-organisms which exist in the air and water. The air in Edinburgh, for instance, contained in wet weather twenty microbes per cubic foot; in dry weather, 120 per cubic foot. After wet weather the air had been washed, and they had fewer microbes. The air of London contained 118 microbes per cubic foot; the air in the London sewers 110 microbes per cubic foot. This was a little surprising, and might seem paradoxical; but he quoted the case of Paris, where fewer microbes were invariably found in sewer air than in the air outside. In 15 drops of Edinburgh water there were 60 of these microbes, but the same quantity of Edinburgh sewage contained 2,200,000. In clay taken from the High Street at a depth of 6 feet no microbes were found; but in soil taken from near a leaking sewer, 15 grains contained 888,000 of these organisms. By means of a lantern and screen, the lecturer gave illustrations of the typhoid, cholera, diphtheria and other micro-organisms, including that of tubercle. Professor Stewart, in concluding, drew attention to the importance of the plumbing trade and the confidence reposed in it by the community. He was not going to lecture them on fittings, but he strongly advocated the abolition of certain insanitary appliances in common use at present. On the motion of Mr. Paterson, Elm Row, the lecturer was cordially thanked for his address.

MANCHESTER ASSOCIATION OF ENGINEERS.

At the weekly meeting of the Manchester Association of Engineers at the Grand Hotel on Saturday, Mr. Edward Wood read a paper on "The Use of Steel in Buildings." Mr. H. Webb, president of the Association, occupied the chair. In the course of his paper Mr. Wood said that in the opinion of many persons the English were behind the Americans in the use of steel for buildings. In America the high buildings were constructed almost entirely of steel, with the floors and walls filled in afterwards. English architects and engineers were now falling into line, and the American system was being largely adopted. The difference in the practice of steel construction between the American and the English system was accounted for to a large extent by the difference in the conditions. The architects in each country were bound by the respective building laws, and whereas what was considered fireproof buildings in England would not very likely be passed in America, it was almost certain that the authorities would not allow buildings to be erected in Manchester of twenty or thirty storeys, or, as they were called, "sky-scrapers." Mr. Wood proceeded to adduce reasons showing why steel was the best material for use in the constructional parts of warehouses, manufactories, engineering works and similar buildings, and also described the most recent

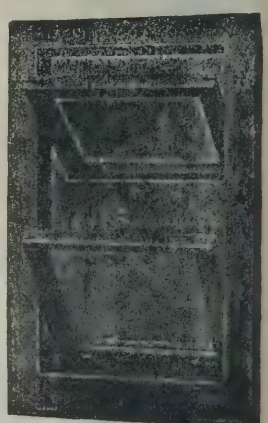
adaptation of steel as applied by some of the leading architects and engineers of the day.

A discussion followed the reading of the paper.

A NOVEL COLONISATION SCHEME.

At the last meeting of the Royal Colonial Institute, the Rev. Alfred Honner (of Adelaide, South Australia) propounded a scheme of colonisation, the main feature of which was not so much the settlement of an agricultural population as the formation of new towns. In illustration of his scheme, the author advocated that application should be made to a colonial Government for a grant of 11,000 acres in a suitable locality, to be surveyed in 1,000 township allotments of one-sixth of an acre, and also 1,000 suburban blocks of eight acres each, with parks, market square and reserves for public buildings. The Government would further be asked (1) to conserve the water, (2) to fence the roads, (3) to provide a small and convenient landing place, if on the coast; (4) to compile a hand-book giving full information as to climate, the soil of each allotment or block, rainfall, coast soundings, fish, minerals, vegetation, &c., for the value of which they would hold themselves responsible. A syndicate would then be formed with a capital in proportion to the number of towns to be colonised—say 100,000*l.* for a town of 1,000 adults. The syndicate would (1) select the settlers in this country; (2) provide each adult with a house of iron or wood made on the same model, costing a maximum of 24*l.* and capable of erection in 24 hours; (3) convey the settlers and their effects to the port nearest their location; (4) establish a store and bank in the township from which all raw materials can be obtained and payments made; (5) allow each adult 2*l.* 10*s.* for tools on the day of location, and also 10*s.* a week for the first year. The manager of the bank and the storekeeper might be the responsible officers of the syndicate in each township, and the syndicate would hold each colonist's land and house on mortgage as security for the money advanced. No payments would be made until the colonist could show that a corresponding amount of work had been done. After the first year a rent would be charged, say in the second and third years 3*s.* 6*d.* per week, and in each of the remaining seven years 4*s.* 6*d.* It was computed that in ten years this would give the syndicate a return of 100,100*l.*, and for the purchase money of the allotments at 1*l.* each and the suburban blocks at 1*l.* per acre a further 9,000*l.* may be added. The sum advanced to the colonists being 52,500*l.*, there would be 56,600*l.* to cover interest and expenses, without taking into consideration the profits that will accrue to the syndicate from the monopoly of trade and banking business. The success of the town would mainly depend on the selection of the settlers, and great care would have to be taken not to have too many persons of one craft. Surplus labour could be absorbed by other towns. Produce would find a ready market in the town, which would largely depend on its own resources. In each of the newly formed towns 500*l.* a week, derived from the syndicate, would circulate for the first twelve months, in addition to the private means of settlers. Churches, schools and public buildings would soon be wanted, and would bring work and capital to the town. For the first ten years the colony would be a "protection" settlement, nothing but raw materials and articles that could not be made by its own people being admitted free of duty. After ten years, when accounts had been squared with the syndicate, free trade would be the order of the day. When once the model of one township was clearly drawn out the same system could as readily be applied to 300,000 persons as to 1,000. In London alone there were thousands who were completely crowded out—enterprise, energy, ability and pluck thus lying dormant and only waiting for a chance. Men who at home had no means of existence after a short time in a British colony had risen to the top of the tree. Disparaging and untruthful accounts of the colonies had deterred many from there seeking new fields, but they offered a paradise to the honest working man and a harvest field for capital. It was an outrage on common sense to say that a country, for example, like South Australia, with a splendid climate, an area exceeding 900,000 square miles, and a small population of 360,000, did not offer greater advantages to labour and capital than these overcrowded isles.



HOMES FOR THE POOR.

Many facts have recently shown beyond question, says the *Daily Telegraph*, that even skilled craftsmen earning good wages experience the utmost difficulty in obtaining dwelling accommodation. And if this be the case with those whom one may fairly describe as "the aristocracy of labour," how much worse is the state of the unskilled, the casual and the ill-remunerated toilers in our midst? It is impossible for the State, through its various popularly elected bodies, whether

these be county councils or local vestries, to recognise any system of housing which does not provide against overcrowding and insanitation, costly though these must needs be under present conditions. Equally it is becoming impossible for the humblest grades of our hewers of wood and drawers of water to pay rents commensurate with improvements that have been effected. Whatever improved education and technical training may do for the rising generation, we have still in our midst a very large population who are unable to fulfil more than the lowliest avocations, yet whose right to family life and a home of a sort none dares to call in question.

In 1862 Mr. Peabody gave that first instalment of 150,000*l.* towards the half million sterling which he presented and bequeathed with the aim "that within a century the annual receipts from rents for buildings of the improved class hereby authorised may present such a return that there may not be a poor labouring man of good character in London who could not obtain comfortable and healthful lodgings for himself and his family at a cost within his means." So pressing, however, became the need of more dwellings in the earlier days of its institution that in order to secure sites advantageously from the defunct Metropolitan Board of Works the trustees—of whom the Earl of Derby was chairman—borrowed extensively. Thanks to excellent financial management, all debts have now been completely cleared off, the last instalment having been paid within very recent weeks, and the trustees, with the Duke of Devonshire as their present chairman, hope soon to be in a position to build yet more blocks. Already the completion of its Stamford Street property, by two, though not large, blocks, has been undertaken. At the present time, according to information readily supplied by its secretary, Mr. J. Crouch, it possesses 5,121 separate dwellings, of which 828 are single rooms, and has a population of just 20,000 upon its estates. Like the Guinness Trust, it gives a preference to poor applicants with large families, and is not over strict when a tiny arrival causes an excess over its nominal "two occupants to a room." Rents here vary from 2*s.* a week for a single room in Shadwell to 3*s.* in Whitechapel, from 3*s.* 3*d.* in Islington for two rooms to 5*s.* 6*d.* in Orchard Street, from 4*s.* 9*d.* in Blackfriars for three rooms to 7*s.* 6*d.* in Pimlico, the average working out at 2*s.* 2*d.* a room, or 4*s.* 9½*d.* a tenement. In last summary of the tenants' occupations no less than 673 are entered as labourers, 513 as porters, 283 as carmen, 194 as warehousemen, 267 as needlewomen and no less than 372 as charwomen.

No less interesting, as it has done its work on a simple business basis, independently of charitable benefactions, is that of the Artisans, Labourers and General Dwellings Company, and no one has had a longer or more practical acquaintance with the difficult question of providing cheap dwellings for the people than Sir Richard Farrant, its deputy chairman and managing director. This great Association, with its capital of three millions, has spent two-thirds of that sum in building operations, and at the present time has in round figures 7,000 paying tenants and houses 50,000 persons. For the better-to-do working people are its cottage estates at Shaftesbury Park, Battersea, Queen's Park, Harrow Road, Noel Park, Wood Green, and it is now developing a property of 66 acres at Streatham. But for the poorer classes it has numerous block buildings—in Lisson Grove, Marylebone, Clerkenwell and other crowded quarters—and in erecting these the directors, who include the Earl of Portsmouth, Mr. Nevil Story Maskelyne, Mr. Mark H. Judge and the Hon. Cecil Ashley, had public-spirited ideas to carry out, as well as to do their duty by their shareholders, to whom a 5 per cent. dividend has been paid for the past twenty years.

"The conditions required, if you are to house large, poor families at the lowest rates, are the advantageous acquisition of sites, well-planned buildings making the most of the ground space, and construction as cheap as is compatible with sound work," said Sir Richard, discussing the subject. As to the difficulties of obtaining sites large enough to be useful, he had much interesting information to give, and is of opinion that the London County Council in its methods in this direction has greatly checked private enterprise. The view, however, that Sir Richard lays down as the fundamental principle that should underlie all dealings with this difficult question is one that he expressed with all vigour and directness before the town holdings committee, to the effect that a landlord has no right to say he will only have a given class of house and occupant. This, as he further pointed out, has actuated the Duke of Westminster in the most honourable and statesmanlike degree, though his Grace has acted so quietly and as a mere matter of course in carrying it out that scarcely any even of those who have directed real attention to this subject are aware of what he has done. But between Oxford Street and Grosvenor Square, near Eaton Square, in Belgravia and in Pimlico, he has set aside plots for working-class accommodation which this company to a small extent, and others in larger degree, have secured for 2*d.* a foot, or from one-twelfth to one-sixth of what might have been obtained for fashionable flats or mansions.

Great as the Duke is as a London landlord, he is not the only one, and if others would follow so notable an example in developing their properties, a material contribution would be made to the solution of this most pressing problem.

At 2*d.* a foot, it is practicable to erect huge block buildings of six or seven storeys upon a big scale, to work out a ground rental (exclusive, of course, of building, taxes and other details) of 3*d.* a room. It is relatively much cheaper to control one vast building than two smaller ones, inasmuch as one rent collector, one building inspector, carpenter and so on can look after it. With some slight modifications Sir Richard declares the Peabody Fund's system of building the best of this kind, and drew attention to the fact that it was far better to construct the staircases so as to be entered from inside the central court and not from the street, inasmuch as one night-porter then sufficed to prevent unauthorised persons from entering, to the saving of expense and the hindering of drunken persons or tramps from occupying the staircases. The average rent of these block buildings is half a crown a room. There are single rooms reserved for women, which may be shared by a mother and daughter or two sisters, in the Lisson Grove buildings, but the greater part of them is planned in two and three-room tenements. The same regulation as that of the London County Council, permitting no more than two to each room, is strictly ordained throughout the dwellings, and young children count equally with adults.

As to the cost of building, it must be borne in mind that materials and wages have risen enormously of late. On this aspect of the matter Mr. Thomas Wilkinson, secretary of the East-end Dwellings Company, had specific figures to give, and mentioned that the cost of the brickwork of the Lolesworth and Katherine Buildings erected in 1885 in Commercial Street, Spitalfields, had been 11*l.* per rod, whereas their last contract, which had recently been signed, was for 16*l.* 10*s.*, and cement, ironwork and woodwork were proportionately dearer. Masons and others worked for shorter hours, and much longer time was taken over building operations. This company provides more single-room tenements than any other, and has some 5,500 residents under its various roofs in East London and in the vicinity of King's Cross. Like the Guinness Trust, its efforts are only restricted by the scarcity of land, as it could furnish capital to any amount for extension, and never wants a tenant for a day.

Meantime the County Council has resolved to build upon a site in Poplar, which will involve some cost upon the rates. It is an altogether new principle, for it has hitherto been a cardinal point that such dwellings should show a nominal 3 per cent. on the outlay. Possibly it may mark an intention of extended activity on its part, and there are not wanting expert critics who think that it might be desirable for the Council to act upon its powers under part 3 of the Housing of the Working Classes Acts of 1891, and put up blocks of buildings wherever it pleases, irrespective of any clearance of insanitary areas.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

23966. Frank Bunker Gilbreth, for "Mixer for concrete cement and other substances."

24151. Henry Brasington and Herbert Brasington, for "Improvements in ventilators applicable for buildings and the like."

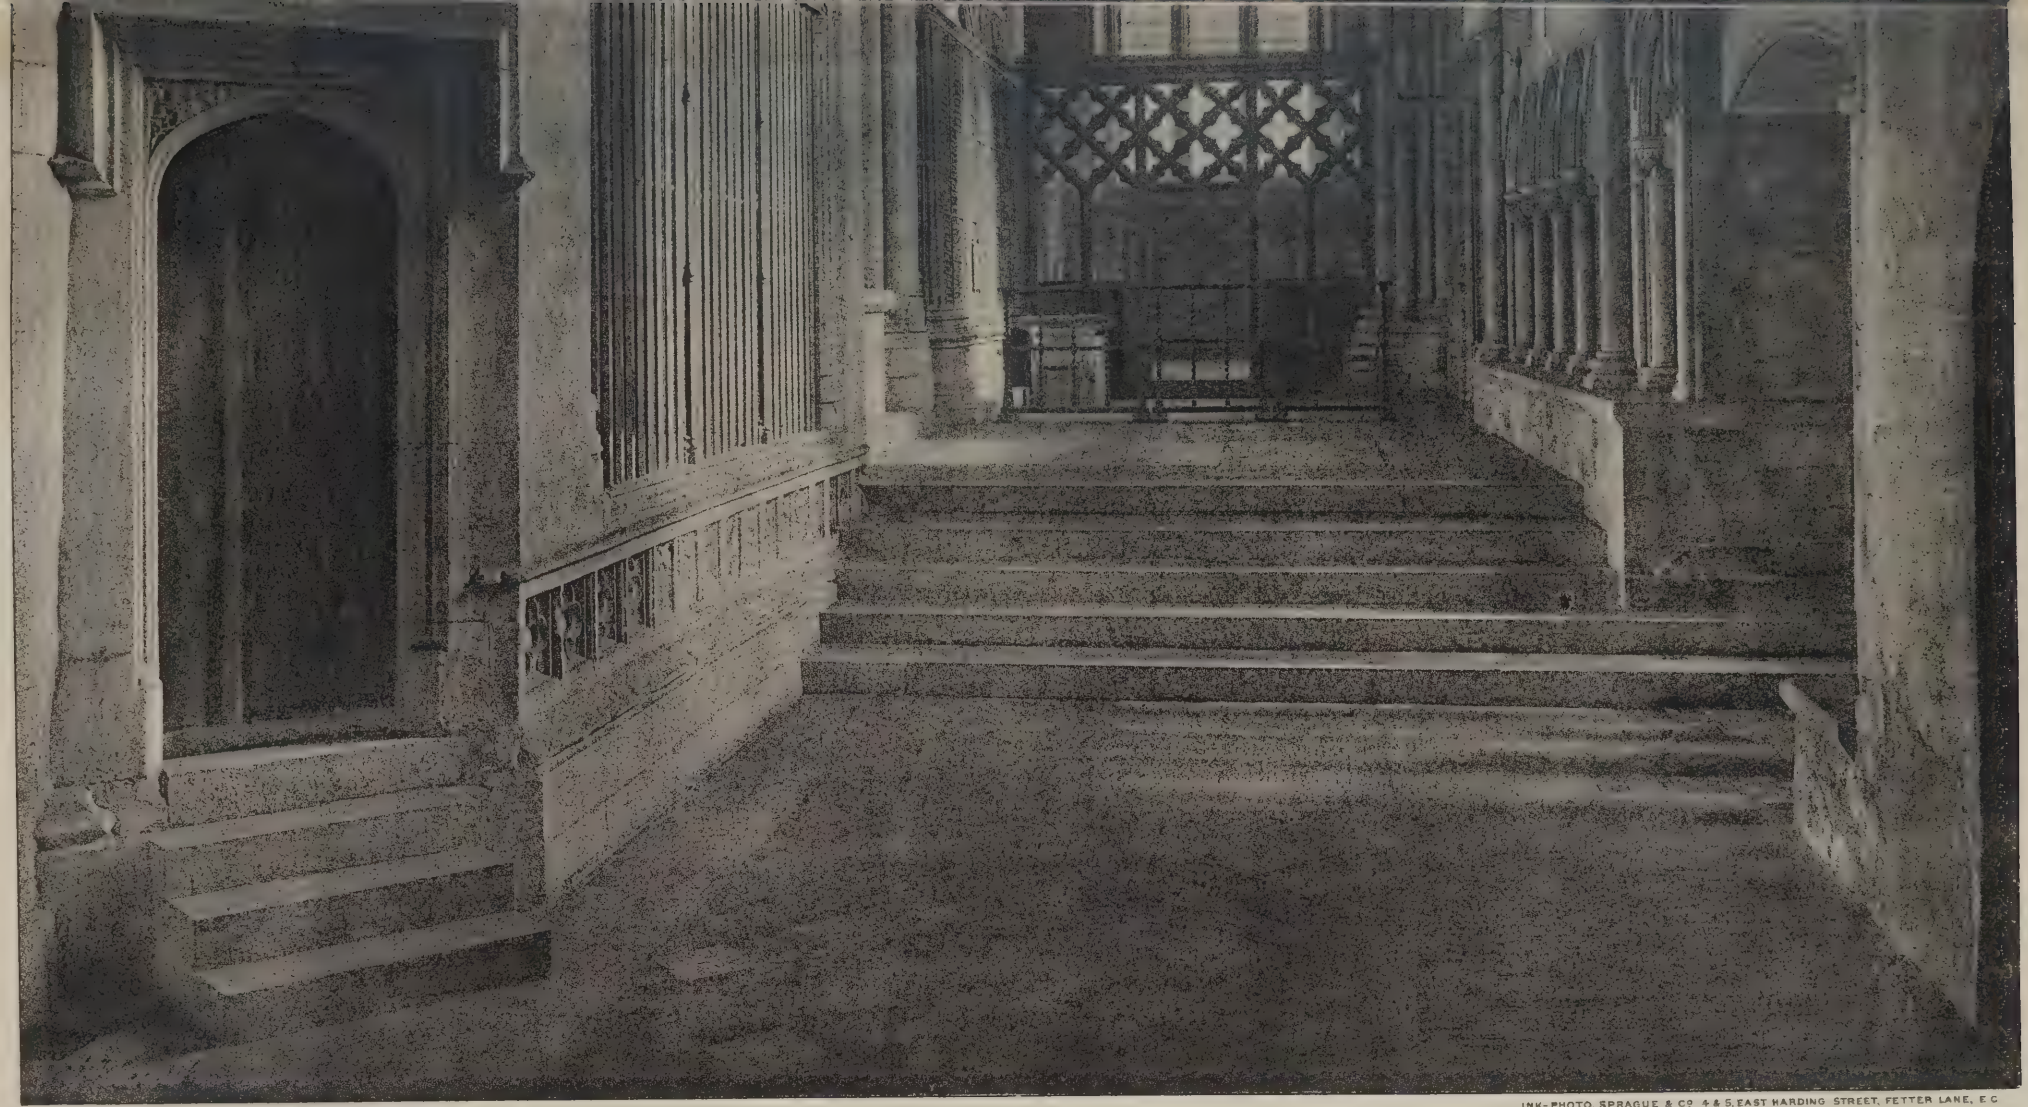
24188. Max Villaret and Joh Baptist Wahlen, for "Improvements in drying and transporting the vices for bricks and the like."

24281. David Janzi, for "Improved cement step."

24285. The United Asbestos Company, Limited, and Joseph Alfred Fisher, for "An improvement in fireproof ceilings and partitions."

Specifications Published.

28842. Gruner, for "Composition for the manufacture of artificial stone, cement and the like."



593. Blackman Ventilating Company, Limited, Wardlf & Tattersall, for "Appliances for moving soft undried bricks."

16666. Ruppel, for "Kilns for cement, lime and the like."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The Architect.

THE WEEK.

It was inevitable that Miss Ethel Mary Charles would be elected as an associate of the Institute on Monday night. With such sponsors as Mr. Ernest George, Mr. Brydon and Mr. Graham, it would have been an offence against decorum to reject her. Besides, Miss Charles had already complied with the prescribed regulations, having passed the three examinations successfully. It is true the tests are inadequate to discover architectural skill, but they are supposed to be efficient in other cases, and why should there be an exception? But if we look at the matter from another point of view than that of Conduit Street, the election could not be well opposed. Ladies have succeeded in painting and in sculpture, why should they fail in an art like architecture? There are lady musicians and writers, while they have succeeded in the management of business establishments, including those of builders and architects. It was also evident to the members that voting against Miss Charles's admission would not be an obstacle to her successful practice as an architect. Any lady can open an office and accept commissions for the erection of buildings although she may have never passed an examination, and there is no law to prevent anyone from giving commissions to lady architects. The Institute ought therefore to be grateful to Miss Charles for the compliment paid in recognising its existence, and, no doubt, sooner or later a reward will be given to the new member, whose only advantage from the election can be the consciousness of a victory over prejudice.

The Corporation of Dublin on Tuesday revealed more good sense than they were supposed to possess. It was proposed to formally accept Mr. Pemberton's tender for the erection of a fire-brigade station. That might be considered a very simple affair, but it was made to assume novel aspects. One of the Councillors declared that the contractor was a member of the Master Builders' Association. In Dublin that is considered to be a crime, and accordingly it was moved as an amendment "That such portions of the tender as are covered by painting, decorating, &c., of the proposed new buildings be deleted and fresh tenders be solicited from the master painters of the city, so as to secure employment for the members of the recognised painters' societies of Dublin." It was not alleged that Mr. Pemberton had ever paid lower wages than other employers, and by the Corporation by-laws it was necessary that qualified workmen should be employed at a standard rate of wages. The intention of the amendment was that painting should be confined to members of the Painters' Society, and of course the same rule would have to be applied to other trades, and in that way the Corporation contracts would be entirely in the hands of trades union men, working or idling as their officers decreed. An instance was cited to show what that signified. In a recent case an attempt was made to compel a Dublin builder who had a contract in an outlying district to avoid employing local workmen, but that he should bring men from Dublin, pay them Dublin wages, to which the district wages should be superadded. That transaction, which was related by Alderman Meade, a builder, was enough to open the eyes of all parties of the Corporation. Only fifteen members showed their indifference to economy and fair play by voting for the amendment, whilst no less than thirty-one ranged themselves on the side of honesty and common sense.

In October last the County Council advertised for a superintending architect, to succeed Mr. Thomas Blashill, at a salary of 1,500*l.* a year. It is remarkable that only twenty-seven applications were received. That was a lower number than was anticipated. The indifference to the opportunity may have been caused by the prosperous condition of the profession. A London architect having an average amount of practice can look forward to a larger income; moreover, it is more agreeable to deal with private clients than with a miscellaneous body like the County Council. Many architects also, we suppose, held back because they declined to lend themselves to the transactions which are inevitable with the works committee intent on demonstrating at all costs the superiority of amateurs to practical builders. It is to be regretted that the general purposes committee are wanting in sufficient courage to explain that the post of superintending architect is, from the constitution of the Council, not altogether desirable. On the contrary, they say that the architects who aspire to the post are not altogether eligible. According to their report, "the applications having been carefully considered and nine of the candidates having been seen, we regret to have to report that we cannot see our way to submit the names of any of the candidates as possessing, in our opinion, the qualifications necessary for so important a position. We are considering what course should, in the circumstances, be taken with a view to filling the appointment." If London was properly governed an architect would be proud to hold such an office, for it would afford him opportunities to increase the amenity of the most important city in the world; that would be scope enough for the greatest architect's ability. But able men know that if they attempted to make the Metropolis worthy of its position they would be hampered by those who should encourage them. The office has therefore to be considered simply in its financial aspects, and as 1,500*l.* is not adequate remuneration for the toils and troubles which are inevitable, superior men act wisely in being deaf to the County Council's invitation.

Another decision has been given on the important question, What does 30 feet high mean under the Workmen's Compensation Act? A labourer claimed compensation from Mr. Goodall, a builder, for injuries which he suffered while working at a building in Bermondsey. In the course of the evidence, it was ascertained that at the time of the accident the height of the building was only 26 feet from the basement level, although it was 35 feet from the lowest part of the foundations. Judge Atkinson, Q.C., was of opinion that foundations were not to be reckoned. The height was to be 30 feet from the level of the basement, and, as the building was 4 feet short of that dimension, judgment was given for the builder. Mr. Goodall did not seek costs, and generously offered to keep the man in his employment. Judge Atkinson took the opportunity of pointing out the mischief which was caused by inserting an appeal clause in the Act, which was alike oppressive to rich and poor. In the case just heard the man was five weeks out of work, and if he had been successful he could receive no more than half his usual wages for three weeks, while for the remaining two he could not be paid. It is now becoming evident that the Act is a white elephant for workmen.

It is no easy work to prepare plans for a large hospital in a hurry, and if it were a private venture the speculators would recognise that extras were inevitable. In work of the kind moments are precious, and an architect must sometimes assume the risk of acting on his own responsibility instead of insisting on the usual procedure of written orders. Considering the size of the Brook Hospital, and the circumstances under which it was undertaken, a sum of 1,300*l.* is not an extraordinary expenditure to have incurred "without any justification whatever." For it is only about one-half per cent. of the total cost. Many cases could be cited where a far larger outlay had to be incurred by the architect. There is nobody who has had experience of works of the kind but will agree that Mr. Aldwinckle has had reason to remonstrate in still stronger language than he has used for the way in which the expenditure on the Brook Hospital has been brought under public notice. Only in an official sense were there grave irregularities, and that phrase has been so often applied to trifling differences in accounts that it has lost its value. When it is admitted by a Government inspector that the architect was only actuated by a desire to produce a "hospital of the best possible type and fitted with all the newest improvements," it is not fair to allow it to be implied that he was incited to extravagance in order to increase his commission. Are all Government buildings completed without the introduction of extras?

BOHEMIANISM AND ARCHITECTURE.

If anyone asked Schaunard, or one of his gay companions who are depicted in Henri Mürger's "Vie de Bohême," whether architects were artists he would be sure to reply in the negative. He would maintain that the artistic temperament was displayed in the wild life he and his friends followed, and from which architects were excluded. Accordingly, he would confine art, in the highest sense of the word, to painters, sculptors and musicians, with an occasional relaxing of the rule in favour of some poet who was appreciated by infallible judges like himself. The real Schaunard did not do much for French art, and after several years' indulgence in dreaming about the greatness he was to attain and his superiority to other men, he wisely condescended to inherit a business and settle down as a commonplace representative of the bourgeoisie. Many other Bohemians who have followed him would be prepared to draw the line like Schaunard. It cannot be said their classification is of no value. It has been adopted not only by professors of æsthetics, but by organisers of international exhibitions. According to some of these, architecture is the first of the useful arts, but owing to its peculiarities it cannot be comprised among the fine arts or beaux-arts.

It is always difficult to say by what process conclusions are arrived at. We all profess to be directed by the dry light of logic, and although we may not adopt the syllogistic form, yet we flatter ourselves that our thoughts are as systematically arranged as if they were expressed by symbols. But impressions, remembrances, associations are not without their influence, even when we say, "No B is C, All A is B, therefore No A is C," or form any of the ratiocinative figures. As in Paris students of all classes are drawn together in their youthful days, they act and react on one another. It is therefore easy to understand why so many, when they have attained maturity and should be serious, retain an affection for bohemianism, although they were only allowed glimpses of it in their youth. If they become professors or administrators, authors or ministers, they cannot when they are reasoning with apparent rigour escape from the old prepossessions. When they were young they found students of architecture to be a class apart, and the prejudice remains. Consequently the French architects have often occasion to complain that in the Chamber and in the press they are not treated with the same tolerant consideration as other followers of art. There is little mercy for them. From what is said it might be imagined the architect was more of a notary than of an artist.

It is well there should be one important peculiarity about architects which distinguishes them not merely from painters and sculptors, but from most classes of men. They have the disposal of money which is not their own, and consequently they have responsibilities and liabilities which are not common. In France, for instance, an architect can be compelled to keep a building in a sound condition during several years; his acceptance of a commission is taken to be a guarantee of the success of whatever he plans. In the Code there is no mention of similar responsibilities for musicians, painters, sculptors, poets or littérateurs. In other countries there may not be the same exactness in defining duties. In England it is possible to bring an action against an architect whenever he is not supposed to have acted to the best of his ability, but corresponding actions against painters or musicians would hardly be advised by any trustworthy lawyer.

The painter and sculptor in the majority of cases are, however, speculators and assume all risks. They produce their works how and when they please, and offer them to the market. Who cares by what process they are produced so long as they are pleasing? The artist might be in a state of intoxication whilst engaged on them, or most desultory in his practice; he might be surrounded by bad companions or alone in the cell of a prison; it is not the history of the picture or statue the public seek, but something that will gratify the eyes of a purchaser as often as seen. But how different is architecture. The initiative rarely comes from the author or artist. If he is not in a proper condition during the preparation of his plans, the client is likely to suffer in several ways. It is not, then, to be expected that an architect's office can be made the theatre of those joyous scenes which, according to the popular belief, are very common in the studios of all countries.

When Thackeray was thinking of becoming a painter he lived in Paris, and he has recorded the manner in which men of that class pursued their calling. The young artist, he says, arrives at his atelier at a tolerably early hour, and labours among a score of companions as merry and as poor as himself; "the pictures are painted in the midst of a cloud of smoke, and a din of puns and choice French slang and a roar of choruses, of which no one can form an idea who has not been present at such an assembly." As for the artists, Thackeray said they were indescribable. Yet he owned that "in France the honours to be acquired by art are only inferior to those which are gained in war," and that painters comported themselves towards sober citizens "as the military man during the Empire did to the *pékin*: from the height of their poverty they look down upon him with the greatest imaginable scorn—a scorn, I think, by which the citizen seems dazzled, for his respect for the arts is intense." There could not be that sort of conduct in England even if the arts were more worthily prized among us. Nor in France could an architect dare to produce his plans amidst such boisterous surroundings. In England the attempt would be disastrous. Accordingly, if a multitude of people believe that the artistic spirit is only to be displayed amidst clouds of smoke and roaring choruses, then it must follow that architects are deprived of it. It is, however, in that way the world argues, and consequently architecture ceases to be a fine art. People in general cannot separate art from the artist, and as the artist who creates fine buildings cannot resemble the painter, sculptor, composer in his manner of production, it is perhaps allowable to suppose he is the inferior rather than the superior of those engaged in the arts for which the public have most admiration.

If any architect should be discontented because he is not classed among the men who are ordinarily accepted as artists, he can console himself by remembering that in all times his art remained "aloft in awful state." The feeling towards architecture may be judged from Vasari's account of himself. The majority of readers do not realise he was an architect. "Messer Giorgio" was an honest man, who did not wish to make himself out to be in any way superior to the majority of the artists of whom he wrote. So practised a writer could easily make capital out of his buildings. But he passes quickly over them, and underrates his skill as an architect. He assures his contemporaries that if it were not for Michel Angelo he probably should not have attempted the study of architecture; that his work for Duke Cosmo was undertaken "rather in obedience to his commands than as having any great hope I should succeed," and that in all cases his architectural work was forced on him. All Vasari was ambitious to prove was that he was one among painters, and that he made no claim to the manysidedness of the great Renaissance masters. His designs at Lille, which he prepared for Michel Angelo, almost give the lie to his autobiography, for they testify to fine architectural skill. But the honest artist knew what it was to be an architect, and, like Tennyson's shepherd, asked, "What pleasure lives in height, in height and cold, the splendour of the hills?" He was content to be an average artist, and in his time that did not signify an architect. As if to make his position more plain, Vasari announced he did not do his work single-handed, for he said:—"As architects cannot always be at work, it is of the utmost advantage to them to have a faithful and friendly assistant, and if no other ever knew this, I know it well, and that by long experience." From Vasari's words about himself we can realise the position of architects in his day, and the reverence with which they were treated.

Vasari had good reason to have some misgiving of his competence to undertake the duties which were assigned to architects in Italy, for they appeared to be without limit. When we read that Cosmo de' Medici sent Brunelleschi to the Pope as a man who was competent to move the world, it would seem as if the art must have been considered as having magical powers. If, therefore, Leon Battista Alberti, who was accepted as the arbiter of taste by his contemporaries, had declared that painting and sculpture were not true arts, the connoisseurs of the age

would have bowed to his decision, and who can say whether it would not still prevail? When we find Giuliano da San Gallo, Baldassare Peruzzi and others defying Popes, and that cardinals and bishops were treated as inferior beings, it is evident that the architects must have been convinced they were on account of their talents elevated above ordinary men. Some claimed to have power that was almost divine. It could not be expected that they would take part in those scenes which were incidental to the lives of the majority of painters and sculptors of the Renaissance period. It is recorded of several of the architects that they lived like nobles, conducted themselves as grandees, and were loved by princes as if they were brothers. When Andrea Contucci failed to satisfy Lorenzo de' Medici, and excited the ire of the master of Florence, the King of Portugal was proud to interfere in order to make peace between the architect and the prince.

It was not to be expected that men who were so prized should be the associates of the painters and sculptors, who were so numerous they were classed with mechanics. Still less was it becoming in them to share in the practical jokes and buffooneries of which there is relation in the histories of the Renaissance period. Architects were expected to respect themselves. That the law on the subject survived long after the decadence is suggested by the remark of Milizia, who, when describing Martino Longhi, said, "His general character was too depraved to admit the possibility of his being a good architect." In other words, Longhi was too much of a Bohemian to be a skilful designer.

If we could have the testimony of the artists who shared in Longhi's revels, we may be sure they would declare he was more of an artist than his serious contemporaries. Men who have only their own interests at stake can afford to take life as a pastime, and naturally assume that dissipation and inspiration go together. Unfortunately philosophers too often have taken the same view of artistic production, and have supposed that those who, by a resolute will and a sense of duty, escaped temptations were not entitled to be considered as artists.

AN ARTILLERYMAN AND ARCHÆOLOGIST.

SOME people were surprised when they found that Lord Kitchener was able to speak with precision about affairs which are usually supposed to be within the province of specialists only. His lordship's calculations about the cost of a railway in the Nile Valley might have come from an engineer who lived in Great George Street, Westminster. More recently his estimate of the amount required to set up the Gordon College in Khartoum was not disputed by educationists, who are of all men the least disposed to accept figures from amateurs, whether civil or military. The fact that Lord Kitchener carried out a war for a smaller sum than he had estimated is enough to compel City men and others to have faith in his figures. His financial skill is, however, only what was to be expected from a Royal Engineer. That most useful branch of the army to which Lord Kitchener belongs is a capital training school for any one who desires to be taught the meaning of the saying, "Take care of the pence and the pounds will take care of themselves." It is only necessary to look at one of the schedules of prices prepared for Ordnance contracts to realise the exactness which is employed in dealing with building works. There are no officers in the army who have to endure more scrutiny from civilians in the examination of accounts than Royal Engineers. It is usually an exasperating process, but it has at least the advantage of compelling the sufferers to realise the value of money and to be exact in their calculations.

It would, however, be an error to suppose that the Corps of Engineers has only one extra subject in its instruction, viz. finance. The versatility of both officers and men is hardly to be measured. There are politicians who still say that Lieutenant Drummond, the inventor of the limelight, who on an emergency was asked to fill an under-secretaryship in the Irish Office, was the most practical of all the statesmen who planned schemes for the regeneration of the unhappy island, and that whatever improvements were since realised were due to him. Several years afterwards another officer who was charged with the superintendence of the engraving of Ordnance maps was appointed under-secretary in Ireland, and he became as able an administrator as if all his life were spent in training for governing. No statesman doubted the aptitude of the corps to undertake the most diverse duties, with one important exception—that of commanding an army in the field. It was not until the Abyssinian war that a Royal Engineer was permitted to have the charge of a campaign.

We do not intend to force an eulogium of the services of that branch of the army on our readers. But when we see and hear all that is being done to express satisfaction with the efforts of an illustrious officer, it is difficult to resist thinking of his predecessors who laboured so well for England, but who were without the satisfaction of knowing that their services were appreciated by their countrymen. We wish to notice one of them whose name is not unworthy of comparison with Lord Kitchener's, and for several reasons should have particular interest for architects and archæologists; in other words, we mean to glance at the services of William Martin Leake.

For Leake it can be claimed that he was the first of the numerous nineteenth-century explorers of Greece. He was the pioneer that Cockerell, Barry, Inwood, Angell and others were proud to follow. In the present day, when excursions throughout Greece can be arranged in London, and on as definite terms as an excursion to any part of England, it is not easy to realise that when the century dawned the country was almost as inaccessible as a remote region of Africa. During three centuries only an occasional traveller was to be seen in Athens after long intervals, and it seemed as if the nineteenth century was likely to send few men from the West of Europe. In February 1688 the Venetians who invaded Greece decided on the destruction of Athens, and the Council of War could have offered as an excuse that no civilised people had the slightest care for the city and its temples. James Stuart and Nicholas Revett did not appear in Athens until 1751. Although the first volume of the "Antiquities of Athens" when published in 1762 was a revelation which surprised scholars, yet they could not screw up their courage to visit the nursery of European arts and literature. There could not fail after Stuart and Revett's work was completed to be an increased interest in the remains of Grecian art. It must have been widespread in this country, for it was in 1799 that Harrison, the architect, when he heard of the appointment of his client, Lord Elgin, as ambassador to Turkey, explained to his lordship the advantage of having casts of the remains for the use of English artists. Acting on the suggestion, Lord Elgin engaged a party of architects, draughtsmen and modellers, in Rome, for the purpose of securing drawings and casts of the most interesting remains. They were provided with formal documents authorising them to erect scaffolding around the Temple of Idols, as the Parthenon was then called, to take copies in gypsum and plaster of the figures, and to remove pieces of stone with old inscriptions or figures thereon.

About the same time William Martin Leake appeared on the scene. He was an artillery officer, for in those days sappers and miners, or Royal Engineers, had not an independent existence. He belonged to an old Essex family, and was born in 1777. Having a turn for scientific warfare, after training at Woolwich he obtained a commission in the Artillery. It was as an officer he found himself in Greece. At the beginning of the century France was sending out emissaries of civilisation, and then as now it was considered the duty of England to oppose them. Then as now Egypt was expected to become a theatre of war, and as the Turk seems always destined to be in a state of tutelage, it was decided to send English officers to drill the men for serving cannon in Egypt. One of the instructors was Captain William Martin Leake. As everything at the time was chaotic in Turkey, it was difficult to define the duties of the English officers or to determine how they could best carry out their mission. To study the country was considered to be one of the earliest duties. Accordingly, Leake formed one of a party that was sent in 1800 overland on a roundabout journey from Constantinople to Cyprus—a journey

that was usually undertaken by sea. He returned by the Archipelago in a sailing vessel. It was his duty to make observations along both routes. But while he did not neglect to study the strength and weakness in a military sense of that part of Asia Minor, he was able to lighten his task by recalling some of the events which were transacted there and of which he had read when a boy at school. He was next sent to Syria, and then to Egypt to undertake a survey of the Nile Valley as far as Assouan.

From Egypt he was ordered to Athens, to superintend some of the operations which Lord Elgin had undertaken. The operations of his lordship gave occasion to the Turks and Greeks to remove fragments without authority, and there was a risk that Lord Elgin's spoils would not be respected. To remove the large pieces of sculpture which are now in Bloomsbury along ill-formed roads was not an easy task, especially with improvised conveyances. Leake was, however, able to see them on board the *Mentor*, an English copper-bottomed yacht. But she foundered off Cerigo. That brought new trouble, for it was difficult to find divers and more difficult to raise the heavy blocks of marble. The sculpture was at last recovered and again despatched to London. Leake followed, but he had no sooner arrived than he was sent in haste to make a military survey of the coast of Albania, and to give the Turkish officers the benefit of his advice about strengthening the weak points. An attack by the French was anticipated, while Russia was expected to aid the Ottoman. In that case Leake was to supply the Russian army with any information he possessed. As if military surveying, fortification and strategy were not enough to occupy the hours of a man, he was instructed to obtain accurate information about the character of the country for use by the Government in England.

The whirligig of time revolved quickly in that age, and the foes of one day were friends the next. Leake was taken prisoner by the Russians he was deputed to advise. On his release he was sent on a secret embassy to Ali Pasha, whose position was equivocal. The French were also endeavouring to make a tool of the despot, and in fact, as Byron says, men of every clime made a resort of Ali's palace. Leake was successful in winning his confidence, and remained with him in an official position.

But it is only on occasions like the present, when Russians, Turks, Egyptians, French and English are again engaged in a game of politics, that Leake's military and diplomatic feats can be recalled. Ali Pasha of Janina is now remembered chiefly from Byron's tribute to his power (he was the original of Lambro, the father of Haidée), and from the description by another Haidée of his murder in "Monte-Cristo." The services of Leake are not celebrated in poems or romances, and must therefore be unknown to another generation. Records of them are, of course, entombed among the archives of the Foreign Office, but he would be a brave man who would seek to exhume the documents. His services to archæology merit a more general acknowledgment. Leake brought to the study of the subject all his skill as a military surveyor. He believed in measurements, and he applied them with a care for which he could have no precedents. In his surveys he was not satisfied with noting what he looked on ; in his mind's eye he could also behold a place or object as it appeared to an ancient Greek, and by his comparisons of measurements he attained identifications which were not possible by any other process. It is true that the conclusions he drew from some of his surveys have been disputed, but there is a wide difference in the satisfaction which a later enquirer derives when confuting a precise statement and that one has with overthrowing a vague assertion. In one case we are dealing with a plan, in the other with a sketch. Leake's "Topography of Athens," in common with his series of travels in Asia Minor, the Morea and Northern Greece, cannot be considered as adapted for those who run and read. They have too much the character of official documents or terriers prepared by a sworn surveyor, but as books of reference they are invaluable. They supply information which he alone among ancient and modern travellers was at the trouble of preparing, and, as far as can be judged by the dispositions of men in our time, they are never likely to be superseded by a more detailed or more exact information. His immense labour has something pathetic in it when we compare it with the results. As Hettner says, "We know almost nothing of what ancient Athens really was, for, in spite of all that has been done, the site and circumference of the Agora remains uncertain."

Leake remained in the Artillery until 1823, when he retired, having attained the rank of lieutenant-colonel. He had nearly forty years of leisure before him. That time he devoted to the preparation of his various books of travel. Another favourite study of his was Greek coinage, and during the latter part of his life his happiest hours were devoted to it. He lived until 1860. If the readers of his books are not numerous they are at least most loyal to his memory, for they see in him a type of those who have an infinite capacity for taking pains—men who cannot write a sentence unless with the conviction that they are recording a truth.

THE BROOK HOSPITAL.

On Saturday last a meeting of the Metropolitan Asylums Board was held. Mr. E. Galsworthy presided. The most important part of the proceedings was the reading of the following letter from Mr. T. W. Aldwinckle, architect of the Brook Hospital, *apropos* of the report of Mr. Knollys, inspector of the Local Government Board :—

"December 2, 1898.

"Sir,—I am duly in receipt of your letter of the 21st ult. enclosing copies of letter from the Local Government Board of the 7th and 10th ult., together with a copy of the inspector's report referred to in the former of the two letters, all relating to the recent inquiry as to the expenditure on the erection of the Brook Hospital.

"I have carefully read Mr. Knollys's report, and, although not agreeing with all the conclusions at which he has arrived, cannot but recognise his manifest desire to be fair to me, although he would appear to be strongly prejudiced against me in the matter of the Fountain Hospital (somewhat unnecessarily introduced into his report), my action in connection with the erection of that hospital having been fully endorsed and approved by the Managers.

"In his report on the Brook Hospital Mr. Knollys has very fairly considered the points and figures which I laid before him at the inquiry, and he has very carefully classified all those items which were authorised by or executed with the knowledge of the Managers or the committee, leaving only 12,000*l.* to be accounted for. Of this amount he states that a considerable part, although not authorised by the committee, 'was necessary, or at least very desirable, in connection with the erection and fitting-up of the buildings,' and he only mentions two items, viz. 655*l.* for teak flooring and 663*l.* for ward stoves, as having been ordered by me 'without any justification whatever.' While not agreeing with him that these were unnecessary, I would point out that this is a very small matter in connection with an expenditure of over a quarter of a million.

"There is nowhere in Mr. Knollys's report any suggestion that there has been any waste of public money, or that the Managers have not received full value for their expenditure ; but he speaks strongly—somewhat too strongly, I venture to think—as to some of the work having been ordered by me without the authority of the committee. I have never suggested that, in this respect, I adopted the right course ; but I have always said, and still maintain, that the Managers' interests have not suffered thereby. I am glad to have the inspector's opinion that in acting as I did I was actuated by the desire to produce a hospital 'of the best possible type, and fitted with all the newest improvements that medical or architectural science had advocated,' and I believe that in the Brook Hospital I have achieved this.

"Mr. Knollys states in his report that I resented his calling my attention to the fact that I should have exercised particular care as regards the increase of expenditure because the amount of my fees might be influenced thereby. I am quite sure that he would not intentionally offer an offensive suggestion, but at the inquiry I indignantly repudiated, and still do so, any suggestion that I increased the amount of work in order to augment my fees. The Managers' experience of me is, I think, in a contrary direction, as I voluntarily surrendered 2,200*l.* of fees which were legitimately due to me in connection with the erection of the Fountain Hospital.

"I wish that I could find in the two letters of the Local Government Board evidence of the same fair spirit as displayed by Mr. Knollys. No allowance is made in these letters for the very short time in which the plans had to be prepared, nor for the very great and exceptional difficulties presented by the site ; difficulties which could not possibly have been adequately realised by anyone in the short time at my disposal, and language of extreme censure is employed, for which there is no

adequate justification. The expression 'grave irregularities' should not be used in relation to an architect of my professional standing, and who has done so much important public work (chiefly under the control of the Local Government Board), simply because some items have been ordered by me without authority, while no suggestion is made that public money has been wasted thereby.

"The paragraph of the Board's letter dealing with the resolution of the sub-committee as to the expenditure of more than 50*l.* at one time without authority is ungenerous. I did not receive notice of this resolution for the simple reason that it was never sent to me. If it had been sent it would have been in the form of a letter, and a press copy would still be in the possession of the Managers, but such does not exist. If I had received such a communication I should not have attempted to deceive Mr. Knollys. I have endeavoured to be perfectly frank to him, and this, I believe, he quite realises. The Board state in their letter, 'There was either neglect in not communicating the resolution to Mr. Aldwinckle, or a failure to keep proper record of the communication addressed to him on the subject.' I indignantly repudiate the unworthy insinuation contained in the latter part of this paragraph.

"Adverting to the second letter of the Local Government Board, dated the 10th ult., making a deduction from my fees of the sum of 375*l.*, I can only observe that, while quite indifferent to the pecuniary loss, I feel that such an act on the part of a great public Department is too trivial to cause resentment, but carries the sting which can give pain. That there has been no waste of public money is clearly proved by the fact that, after making allowance for the additional expenditure caused by the nature of the site, the cost of the Brook Hospital is not above that of the other two hospitals recently erected by the Managers. The extra expenditure due to the site was put by Mr. White's committee at 53,000*l.* I think this is somewhat under the mark, but even with this deduction, the ordinary cost has been 215,000*l.*, which is not, I think, in excess of the other two hospitals.

"At the same time it is admitted on all hands that the Brook Hospital, although the pioneer of hospitals of this class, with no precedents to guide me in its design, is a good hospital, completely finished in all respects and worthy of London. During the two and a half years since its opening no defects have appeared in the buildings, and the hospital stands now without a flaw. The precautions taken by me in providing the foundations have been so efficient that, even during the recent severe drought, so injurious to buildings placed upon a clay soil, and especially when on the slope of a hill, not a trace of any settlement or fracture has appeared. The work throughout the buildings is good, of the highest class, and of a distinctly permanent character, while many details of construction, notably the ward floors and ward stoves, have been adopted by other hospital authorities. Although I have been for the past eighteen months the subject of many attacks, I have never wavered in my belief that the Managers either recognise now, or will do so in the immediate future, that I have done justice to them in the design of this hospital, and estimate at their true value the difficulties which I have had to encounter. I am, and shall always be, proud of being the architect of the Brook Hospital, and long after the criticisms of the Local Government Board shall have been forgotten, the hospital will remain as a monument of good work done under circumstances of exceptional difficulty.—Yours faithfully,

"(Signed) THOS. W. ALDWINCKLE.

"Mr. T. D. Mann."

On the motion of the Chairman, seconded by Sir Douglas Galton, it was resolved to enter the communication on the minutes, to forward a copy to the Local Government Board, and to circulate it generally.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening at Conduit Street, Professor Aitchison, R.A., president, in the chair.

The following gentlemen were elected fellows of the Institute:—Messrs. Robert Lockhart McCowat, William White Cooper, M.A., Henry Thomas Hare and William Henry Duffield.

Fourteen candidates were elected associates:—Messrs. J. C. Baines, C. W. Surrey, Albert Herbert, Louis Moore, P. C. Blow, James Stockdale Harrison, A. R. Gough, Charles Riddey, V. Evans Bösher, R. W. Carden, A. W. Vercol, Alexander Cowie, Gerald McMichael and Miss Ethel Mary Charles. The election of the last-named seemed to cause excitement and some opposition. Miss Charles was a probationer in 1892, student in 1895, and qualified in 1898. Her election was proposed by Messrs. Ernest George, J. M. Brydon and Alexander Graham.

Sir Alexander Binnie was elected an hon. associate.

Mr. H. D. Searles-Wood read a paper by Mr. R. W. Gibson (New York) on

Fireproof Construction of Buildings in the United States.

Mr. Gibson's paper commenced with a brief sketch of the development of fireproof construction in the United States, showing that the first efforts had been disappointing through lack of perception of the difference between incombustible materials and fireproof materials. The exposed iron systems had failed signally, collapsing to the heat of burning fittings, furniture and stored goods. The modern system had developed from these experiences upon an ancient pattern of floors composed of wooden beams buried in masonry, using steel and iron instead of wood, and perfecting and systematising fireproof protection. The latest phase was the entire elimination of the combustible materials hitherto used for doors, floors, architraves, &c.; the selection of materials fire-resisting as well as incombustible, and the use of these to protect others which must not be used unless so protected. Materials most available were steel or iron for strain-bearing purposes, and brick or terra-cotta and plaster to clothe and protect the metal. Masonry materials required careful selection, some granites and marbles being liable to destruction at the earliest blasts of a severe fire. Fireproofing must be such that, when the fire occurs it will not be washed off by the heavy torrents of water thrown upon it by the modern fire-engine. Of the several classes of fireproofing accumulated experience pointed to the infinite superiority of fire-resisting terra-cotta, which had always performed the duty required of it. Probably 95 per cent. of existing fireproof work was of terra-cotta construction. The structural ironwork might be divided into three classes, suited to as many types of fireproof buildings. First, the building of ten storeys or less, erected by the old methods of supporting walls and superimposed columns carrying floors and roof, and with only small beams and girders or occasional independent trusses. Secondly, the building of more than ten storeys, which accumulated such strains upon its walls that they must be reinforced by posts to carry the girder loads, and in which the walls required such mass in their lower parts to support their own upper parts that the metal first introduced to support the floor girders was reinforced and called upon to support the upper walls. This was the so-called skeleton construction. At a height exceeding twelve storeys, or when exposure to wind and other strains was great even at this height, the ordinary attachment of columns and girders was abandoned, and horizontal stability supplied by rigid rivetting of all connections of posts one upon the other, and of girders to posts and beams to girders, and by the addition of bracing in ties and struts and gusset brackets, thus developing the so-called cage construction, wherein the steel receives and transmits all loads to the foundations; and the walls have become mere panels, not only without vertical loads, but without transverse bracing strains. Thirdly, an intermediate type of building where all the internal structure and all the floor loads were supported upon columns, some being placed in the outside walls, the outside walls being made of self-supporting thicknesses in cases where architectural treatment demanded sufficient mass for the purpose, and where the foundation presented no difficulty. In buildings of the third type, erected in many storeys and let for business purposes, almost perfect fireproof qualities had been achieved. In such buildings there was no danger to life from fire, or of the fire spreading from the room where it first occurred. This type had become systematised by custom and experience, so that its structure was uniform throughout the country. The floor loads are supported upon columns of rectangular shapes of rolled steel, the outer columns being set in the outer walls in grooves, close-fitting but without bond, so as to permit of unequal movements and settlements and contraction. Girders are of rolled steel, built and rivetted for large sizes, and of I-beams for smaller (24 inches and under); they are all rivetted to the side columns, so that these may be continued right through the height of the building in practically one length. Bracing is done with gusset plates and angles. Beams supporting the floors are small (8 or 9 inches) rolled steel I-beams, laid 4½ feet apart. The size of the beam and spacing arise from the use of the terra-cotta arch, of from 8 to 10 inches in thickness. These arches, which are very economical, very adaptable and elastic in their application, are made of hollow terra-cotta blocks, with joints inclined at a fixed angle. The blocks are of three patterns, viz. the springer, which rests on the flanges of the floor-beam; the intermediate blocks, which are all cut to the same inclination; and the key-block, with the sloped joint on both sides. The work is set upon a centering consisting of simple scaffold boards hung 1½ inch below the soffits of the iron beams; upon this centering the arch-blocks are laid, and then jointed and flushed in cement. When the work is set the centering is removed to a new panel, so the work goes on continually. Upon the arches a layer of cinder concrete is deposited, and upon this the finished floor, consisting of paving

or tiling, or a composition of a concrete nature, or sleepers and wooden floor. For buildings having floors weighing from 75 lbs. to 95 lbs. dead load per foot, and supporting live loads from 75 lbs. to 150 lbs., the distance between the main girders would be between 14 and 18 feet, which being a convenient size for a single office is also taken as the unit of room width and the space allotted in the outer walls to a pair of windows. The roof is constructed with arches, the same as the floors, except that sometimes the steel beams are laid to the necessary pitch of about half an inch to the foot, so as to avoid the weight and expense of filling, which would be necessitated by level beams and arches. The thickness of the walls is about two-thirds that required for walls supporting the floor loads, and they are secured to the metal framework so as to receive its assistance in resisting horizontal wind pressure. Thicknesses of walls for buildings of varying height and construction were quoted. The thickness necessary to resist the weather is found to be 12 inches at least of brickwork, with terra-cotta interior furring. The furrings are hollow terra-cotta slabs or tiles 2 inches thick and 16 inches by 8, or other convenient sizes, built up against the inside face of the wall and secured with iron where necessary. The interior of the steel frame is protected over all its exposed surfaces by 2 inches of terra-cotta furring. The girders are protected by slabs of terra-cotta, secured with hooks and bars and wiring, and usually getting their outer form by means of metal lath upon light iron bracketing to receive the finished plastering. The lower portion of walls and columns are frequently finished with marble slabs 1 inch thick, or with tiling. Those methods are preferable which place the fireproofing material close to the metal and preserve numerous and frequently broken air spaces in their own substances. A greatly improved and considerably cheaper column protection can be made by using one coat of metal lath and cement in contact with the column, and a second coat furred out from the first upon metal lath upon light iron bars, so as to preserve an air space between the two thicknesses of cement. This protection is finished with hard plaster, proof against the fire-hose. Partitions are built after the structural steel is protected. The best are of terra-cotta blocks, 4 inches thick for average heights, 3 inches for moderate heights, and 6 inches for great heights of storey. They may be stiffened with angle-iron framing, but show extraordinary strength when well set in Portland cement. Minor partitions, and sometimes all the partitions except those next corridors, are frequently built by using light angle-iron posts or quarters covered with metal lath, and plastered either like the old-fashioned wood-plastered partitions, or sometimes with very thin posts and one sheet of metal lathing only, so as to make a solid plaster partition about 2½ inches thick. Three-inch tile partitions dry quicker and cost only a little more. So far the building has nothing combustible in its construction, and the tendency is to more and more reduce the amount of woodwork admitted after this stage. Wooden floors are permitted, but doors and architraves should be of sheet metal, wooden cores being tolerated. Window architraves and jambs should be of hard plaster, and window frames and sashes of chemically-treated fireproof wood or of metal. Windows in internal partitions and doors should have wired glass. Office furniture should be non-combustible, *e.g.* metallic bookshelving, desks, cabinets, letter files, &c. In ordinary fireproof buildings, halls, stairs, corridors and elevator shafts are entirely incombustible. The author next discussed the principal sources of fire, and the manner in which it spreads—the latter a point but little understood, except by firemen; the effect of heat upon metal; an alternative system of steel construction; various forms of floors in use, and the merits of porous terra-cotta, a material preferred by many experts. In conclusion the paper dealt at considerable length with the principles to be applied in calculating the strength of beams, girders, columns and foundations in proportion to the loads required to be borne, quoting the building regulations respecting the matter in New York and Chicago, and the differences of opinion and practice existing among architects there in regard to column and foundation loads. The author's own calculations for a first-class bank and office building designed by him and recently erected in Syracuse were given as follows :—

Load on all beams	= total dead load + 70 lbs. per ft. live load.
Load on all girders	= total dead load + 60 lbs. per ft. live load.
Load on columns of three upper storeys	= total dead load + 60 lbs. per ft. live load.
Load on columns of remaining storeys	= total dead load + 40 lbs. per ft. live load.
Load on foundations	= total dead load + 20 lbs. per ft. live load.

Among a large number of illustrations to the paper were a set of working drawings and specifications and strain and load diagrams of the Syracuse bank designed by Mr. Gibson, which afforded an interesting example of this class of practice in the United States. Photographs showing the building in course of erection at various stages were shown by the lantern. These were followed by a series of lantern slides reproducing details of construction of a thirty-storey building which appeared recently in *Engineering*.

Mr. Gordon Smith, chairman of the science standing committee, who proposed a vote of thanks to Mr. Gibson for his paper, said that when read carefully and at leisure the paper would be found useful to all. There was an immense amount of interest in the subject to those concerned in controlling such constructions.

Professor Unwin made a few remarks, pointing out the importance of iron construction as carried out in America. Although in Chicago they had one of the worst possible difficulties to contend with for such buildings—namely, the poor character of the bed for foundations—yet this system of construction had developed to an enormous extent. The question as to whether they were to build vertically or horizontally was more a matter of custom than anything else.

Mr. W. Solomon, who seconded the vote of thanks, gave an account of a specification which Mr. Gibson had prepared. The American style of drawing out a specification had many points which might be adopted with advantage in this country.

Mr. R. J. G. Read drew a comparison between the English and American method of arranging ironwork.

Messrs. Langton Cole, C. H. Brodie, E.O.Sachs, Max Clarke and Delissa Joseph also took part in the discussion.

DROESHOUT PORTRAIT OF SHAKESPEARE.

In a letter to the *Times* Sir J. C. Robinson says that the Droeshout portrait is neither more nor less than a fraudulent production, like all the other *soi-disant* Shakespearean portraits, whose name is legion. Two or three years ago this picture was submitted to the Society of Antiquaries for the judgment of the members, and the verdict was conclusively against it.

Primâ facie, it might quite reasonably be expected that the original painting or drawing from which Droeshout's print must have been taken would come to light, and so apparently genuine a character was this particular "claimant" that the members of the Society of Antiquaries were at first strongly inclined to believe in him, but this was in the evening after dinner, when people are often inclined to see things in the most favourable light. Usually, however, the evening light was not sufficient to enable any certain judgment to be formed as to the pros and cons of this dark and dirty oil picture.

A reinspection, however, in the full light of day threw quite a different complexion on the matter. It was then soon perceived that the picture was of precisely the same class as the majority of the other *soi-disant* Shakespeare portraits—that is to say, it was substantially an ancient sixteenth or seventeenth-century portrait, painted in oil on panel, which had been fraudulently repainted and vamped up in various ways—metamorphosed, in fact, into a portrait of the great dramatist, probably towards the end of the last or beginning of the present century.

Apparently the original portrait was that of a lady, for the leading forms and details of the work could still be discerned in many places by a practised eye piercing through the fraudulent envelope.

There was, moreover, one other damning circumstance. The picture was painted on a substantial white wood panel put together in the Italian manner, an almost certain indication that the original work was that of an Italian master, doubtless working in his own country. Had it been a genuine contemporary portrait of Shakespeare, on the other hand, painted in this country, the material on which it was executed would just as certainly have been a thin oak panel, simply glued up in the usual English manner of the sixteenth and seventeenth centuries. No doubt was left in the minds of the members of the Society of Antiquaries who were interested in the question as to the fraudulent nature of this "Droeshout" portrait.

The owners of the picture, however, thought differently. They were nevertheless invited to submit the picture to an infallible test, namely, to allow some small portion of the surface paint to be removed by the application of a solvent, the effect of which would be either to disclose again the original surface of the picture or to prove that it was a homogeneous and so genuine work, and consequently really and truly an ancient seventeenth-century portrait of Shakespeare from which the famous engraving might have been made; but this crucial test was declined.

Mr. Sidney Lee, author of a Life of Shakespeare, writes :—

Sir Charles's unqualified assertion that all connoisseurs regard the portrait as spurious is in conflict with the fact that the President of the Royal Academy (who is also director of the National Gallery), the keeper of the prints in the British Museum, and the director of the National Portrait Gallery have all stated grounds for their belief that the portrait is genuine.

Last May Mr. Lionel Cust, the director of the National Portrait Gallery, made, with myself, a careful re-examination of the picture in the gallery at Stratford-on-Avon, where it now hangs. In presence of the portrait I read the argument against its genuineness that was published last year in Mr.

F. S. Robinson's volume entitled "The Connoisseur." Sir Charles Robinson's view, as stated in your columns to-day, is identical at all points with that expressed by Mr. F. S. Robinson in his book. When I read Mr. Robinson's remarks in presence of the picture, I reached the conclusion that Mr. Robinson's case rested on rash assumptions which a detailed study of the picture confuted.

Among Shakespearean scholars Sir Charles Robinson will find, I think, few supporters. Last Thursday I happened to meet Sir Theodore Martin, a Shakespearean scholar of great experience, and a special student of Shakespeare's portraits. He expressed to me with much enthusiasm his satisfaction at my choice of the "Droeshout" painting for the frontispiece of the new "Life," and declared himself convinced 'that that painting was the basis of the far-famed engraving by Martin Droeshout, which appears on the title-page of the first folio edition of Shakespeare's works.

Since writing this letter the director of the National Portrait Gallery has sent me the accompanying note, which he gives me leave to publish. Mr. Cust writes :—

National Portrait Gallery, St. Martin's Place, W.C. :
December 3, 1898.

Dear Lee,—I observe in the *Times* for to-day a letter from Sir J. C. Robinson on the subject of the portrait of Shakespeare at Stratford-upon-Avon. The objections made in it by Sir J. C. Robinson, some of them much to the point, have been carefully weighed and considered during the three years which have elapsed since he first made them, with the result that the belief in the authenticity of the portrait has been increased instead of diminished.

The authorities at Stratford-upon-Avon will no doubt be quite ready to reply to Sir J. C. Robinson on each count of his indictment, should he care to address himself to them.

The controversy is already an old one, and likely, as it would appear from Sir J. C. Robinson's letter, to become crusty. It will never probably be settled to the satisfaction of everybody. Sir J. C. Robinson is entitled to his own opinions, and so are other people, like yourself, who may be considered as also capable of forming some critical judgment of their own in a case like this.—Yours very sincerely, LIONEL CUST.

Sidney Lee, Esq.

INTERIOR DECORATION.*

IT is difficult for a decorator, as indeed it is for one in any calling, to divest himself of the interest he has in his work sufficiently to stand aside and judge of its importance and place in relation to other things. And yet I am convinced that in many minds there exists such an erroneous conception of the functions of decoration as to justify a more emphatic assertion of its importance than is usually made. I imagine that few even among architects would consent to the proposition that a certain room or hall should be designed mainly for the display of decorative treatment, and yet many of the best known buildings and apartments in the world are of little use except for the display of their decorations, and were primarily designed for that purpose. The Sistine Chapel, Loggia of the Vatican, portions of the Louvre and Versailles, the palace at Augsburg and many others suggest themselves. This at once gives dignity to the art. One hears continually of the necessity for making decoration a background for something else, such as pictures, furniture, dresses, people, and in many cases it is desirable, but by no means in all. It would manifestly be impossible to apply a purely decorative treatment to even a moderate proportion of the work undertaken, yet in a modified degree it should be applied to every work of any importance. The ceiling of the room may always be treated purely for decorative effect. Consequently in standard work we find the most elaborate decoration applied there. Nothing interrupts the view, nor is the ceiling so much within the ordinary range of vision as to weary one. But there are rooms in which the walls may be treated almost as elaborately as the ceiling and with satisfactory results. The plea for the pictures is in most houses such a hollow one as not to be worth serious consideration. I have seen the greatest care taken in the selection of a wall-paper for a room both as to pattern and colour with reference to the pictures, and afterwards have seen the walls hung with the most inartistic pictures imaginable. One of Morris's, or Crane's, or Shand Kydd's bold designs would have been infinitely preferable.

I speak of wall-papers because they are of necessity the almost universal covering material for walls. Of comparatively modern invention (no trace of them existing previous to the sixteenth century), no other material has offered itself nearly so satisfactory for transferring design and colour to wall surfaces. And the material itself must be completely ignored, the most successful paper being that in which behind the design and colour there is no thought of paper. To conceal the material in this case is perfectly legitimate, as it is only a means for transferring the design to the wall. On this account we are free to draw upon a great range of other materials, and while there need be no attempt at deception, the fine qualities of silk, tapestry, leather, &c., are obtained at a cost which makes decoration possible.

As in most other work, simplicity is the keynote of decoration. I do not mean by this weak colour or the absence of design. Ordinarily there is neither time nor opportunity for a special planning of each scheme that presents itself for arrangement. So that in most cases a general rule must apply. I have found this to be safest. Allow one colour to strongly predominate in the room. The other and smaller mass should be an analogous colour. Any other colour should be contrasting and small in quantity. Simplicity in colour is obtained by this means. Then ornament should not be weakly scattered over the surfaces but massed in parts. Large plain surfaces are always grateful to the eye. Such decoration as the Moorish or Japanese diaper is no exception to this, for their repeated patterns become really plain surfaces. The decorator's task is made much more difficult by the variety of lines he sometimes meets. Among the most trying rooms to treat are those in which the architect, without apparent reason, has made several heights for doors and windows and has placed these openings without regard to the spaces on the walls. This indifference to spacing of the walls and lining of doors and windows gives no end of trouble in the after decoration and destroys the repose of the room. In fact, the only safe road when such conditions exist in a marked degree is to cover the whole wall with one treatment and thus dodge the difficulty. It is well also to avoid inharmonious colour schemes in the fixed materials, such as woodwork, tiles, &c., not only with each other, but with the probable after treatment of the room in harmony with its character.

Rich colouring is almost indispensable to successful decoration. Even where light tints are used, plentiful use of gold should take the place of colour, for gold itself is very rich and satisfying. As to the use of various colours little can be said in a paper of this nature, but a few suggestions may be of use. Stronger colours may be used on the walls than might be thought possible with good results. The lighter blues are receding and the deeper blues are useful in an over-lighted room. Reds are nearly all assertive, but the strongest reds can be introduced into the colour scheme with happy results. The same may be said of the yellows, some of which will bring positive sunshine into a northerly room. Combinations of blues and greens so often seen in the best designing give a very natural colouring to the wall and consequently freshness. The quieter tones of green alone are also very pleasant, but some of the stronger greens which nature uses are impossible in a room where the other outdoor conditions do not exist. As to balance of colour such combinations as we sometimes see of two-thirds of a wall red and the other third blue are always disturbing, and no room so treated can be restful. Greens with certain shades of brown are usually grateful to the eye. Yellow also forms a happy combination with green.

As to patterns it is an axiom with designers that large patterns are most suitable for very large and very small rooms. You can let the medium-sized rooms take care of themselves. Of course the uses of the room govern the choice of pattern, and the eye naturally selects that most suitable. But it is a mistake to suppose that a large pattern necessarily reduces the apparent size of a room. When due attention is given to the colouring (avoiding contrasts) the reverse is the case. But in a large room small patterns should never be used except as practically plain surfaces, forming a background for something more important. A great deal might be said about adapting the decoration to the habits, tastes and more important still, the purses of clients. But this leads into other topics not within the scope of this paper.

* A paper read by Mr. W. H. Elliott before the Toronto Chapter of Architects.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

A MEETING of the above Society was held at the Chetham Hospital, Manchester, on Friday evening. Mr. C. W. Sutton presided. Mr. W. Harrison laid upon the table a draft map of Lancashire in the Mediæval period, prepared by him in accordance with the scheme for such county maps laid down by the Society of Antiquaries of London. The map showed by various symbols the monastic and collegiate churches, parish churches, chapels, castles, manor-houses and other features of the county existing at the time in question. It was accompanied by a list giving the authority for the insertion of each item. A paper followed by Mr. Thomas Kay, entitled "A Visit to Two Picts' Eirde or Earth Houses in Aberdeenshire." Mr. Sutton afterwards read some notes on the Domesday Survey between the Ribble and Mersey. This last paper was the work of Mr. W. Farrer.

NOTES AND COMMENTS.

Although the new Opéra-Comique in Paris has not received general approval, the architect, M. Cassien-Bernard, has been selected as successor to Charles Garnier to take charge of the opera-house. He is in the prime of life, having reached the half-century. He was a pupil of M. Questel and M. Pascal. Among his works are the theatre of Montpellier, the Ecole des Ponts et Chaussées, and the National Bank, Bucharest. He was one of the premiated competitors for the Opéra-Comique in 1887, and eventually his design was accepted. He was also among the fortunate architects who pleased the judges for the International Exhibition of 1900, and in connection with M. Cousin was entrusted with the bridge across the Seine which is to be called after Alexander III. M. Cassien-Bernard is plainly in the tide which leads to fortune.

Like most cities, Paris has to be enlarged. The tendency in France, as elsewhere, is to undergo sacrifices in order to settle in the capital. The consequences may not be always satisfactory, but they cannot be presented. Social gravitation is as true to the centre as that of matter. Paris is, however, not at present adapted for extension. The fortifications which Thiers had constructed at a most enormous cost are a sort of barrier which in one sense cannot be passed. People go beyond them and are happy in villas north, south, east and west of Paris. But the Municipal Council does not derive much benefit from those emigrants. Accordingly for years past there have been schemes for utilising the ground occupied by the useless fortifications, but without any definite result. At last the end appears to be approaching. It was agreed between the State and Municipal Council to have a valuation prepared of that part of the line of fortifications which lies between Auteuil and Saint-Ouen. As is the case everywhere, the vendors' figures came out higher. The Government valuers calculated the amount at 192,400,000 francs, or about 770,000*l.*; while the Municipal valuers declare the sum to be 133,500,000 francs, or 534,000*l.* The difference is serious, but there is no need of splitting it in this case, for the Government are prepared to accept the amount declared by the Municipality.

In the paper which Mr. Francis Fox read at the meeting of the Institution of Civil Engineers on Tuesday he commented on the inconsistency of keeping houses clean, streets swept and sewers flushed with the object of preserving the air in a pure condition while allowing it to become absolutely foul and putrid for want of proper ventilation. Air passed through human lungs had been well designated "air-sewage." It was highly poisonous, and the breathing of it over and over again was fraught with the gravest consequences to health. It had been asserted by Dr. Ransome, F.R.S., that 70,000 deaths occurred annually in Great Britain from tuberculous disease, nearly all of which could be saved were the subject of fresh air both understood and acted upon by the community. Competent medical authority considered that the quantity of carbon dioxide in the air of rooms should not exceed 10 parts per 10,000, equivalent to about 16 cubic feet per head per minute. In French hospitals 50 cubic feet per patient per minute was allowed. Mr. Fox considered that 20 cubic feet per minute would be sufficient for ordinary purposes. Tables were given of the impurity in the air of schools, with different systems of ventilation, of that in dwelling-houses and of that in sewers, from which it appeared that the latter was the least impure of the three. The fact should not be lost sight of that the air in a room might be quite cold and yet very foul; whilst, on the other hand, it might be warm and yet perfectly fresh. To avoid draught the air should enter through a large number of small orifices so as to thoroughly diffuse the current. This was done by gratings, but unfortunately these seriously diminished the volume of air passing through owing to the friction of the bars. The same remark applied to extracting-flues. No large building could be successfully ventilated without some mechanical force furnished by steam, electricity, falling water, or other such agency. Then, fans could be worked with certain results, whereas automatic extractors not infrequently became inlets, thus reversing the whole system. The inlets should be by Tobin or similar tubes, about 5 feet above the floor. In one American State Legislation building the warmed fresh air entered on the level and in front of the desks of each member.

CATHEDRAL SERIES.—ST. ALBANS: THE SCREEN.

NEW CLARIDGE'S HOTEL.

This hotel is built in the style of the English Renaissance, freely treated. The exterior walls are of red brick, of which a considerable portion is rubbed and gauged, with dressings of red Mansfield stone. The entrance is wholly of this stone and dark Shap granite. A special feature is made of the long ranges of cast-iron balconies. The roof is covered with green Westmoreland slates. The entire construction of walls, partitions, staircases, floors and roofs is of fire-resisting material. All casements throughout the building are of mahogany, and the staircases are marble. The building is arranged on plan with a central square courtyard lined with tinted glazed bricks, and a wide corridor runs completely round the building, the centre of which is occupied on the ground floor by a winter garden, opposite the main entrance. The public rooms consist of a salle à manger, restaurant, billiard-room, smoking, drawing and reading-rooms, arranged around the winter garden. On the floors above the rooms are in suites consisting of sitting, bed, dressing and bath-rooms, each suite having its own hall and connecting corridors, all arranged so that any number of rooms can be added to a suite as required. In addition there is on each floor a large dining-room, which may be used privately or in connection with any suite. The kitchens are in the basement. The service includes all the most modern appliances for the comfort and convenience of visitors. Electric passenger-lifts and luggage and service lifts have been provided, and there is a fire staircase from the top floor to the street in rear. On the first floor, at the Brook Street corner, there is a royal suite, comprising a set of rooms extending along the Brook Street and Davies Street fronts, and having a second entrance in Brook Street. A separate entrance in Davies Street gives access to the salle à manger and restaurant, and another entrance in Brook Street leads direct to one of the lifts and staircases, obviating the necessity of going through the more public parts of the hotel. The entire building is warmed by hot water and lighted by electricity. Another and more general view of Mr. C. W. Stephens's hotel appeared on November 25.

ROYAL HOSPITAL FOR CHILDREN, EDINBURGH.

VILLA RESIDENCES, GROVE PARK, CHISWICK, W.

This design is one of a series of eight detached residences about to be erected on the estate of the Duke of Devonshire, Spencer Road, Grove Park, Chiswick, W. The fronts are to be executed in red brick and pale yellow rough-cast. The half-timber work will be stained with Stockholm tar, the roofs will be covered with red Broseley tiles. Messrs. Palgrave & Co., of Victoria Street, S.W., are the architects for the work.

PREMISES, NO. 46 BALDWIN STREET, BRISTOL.

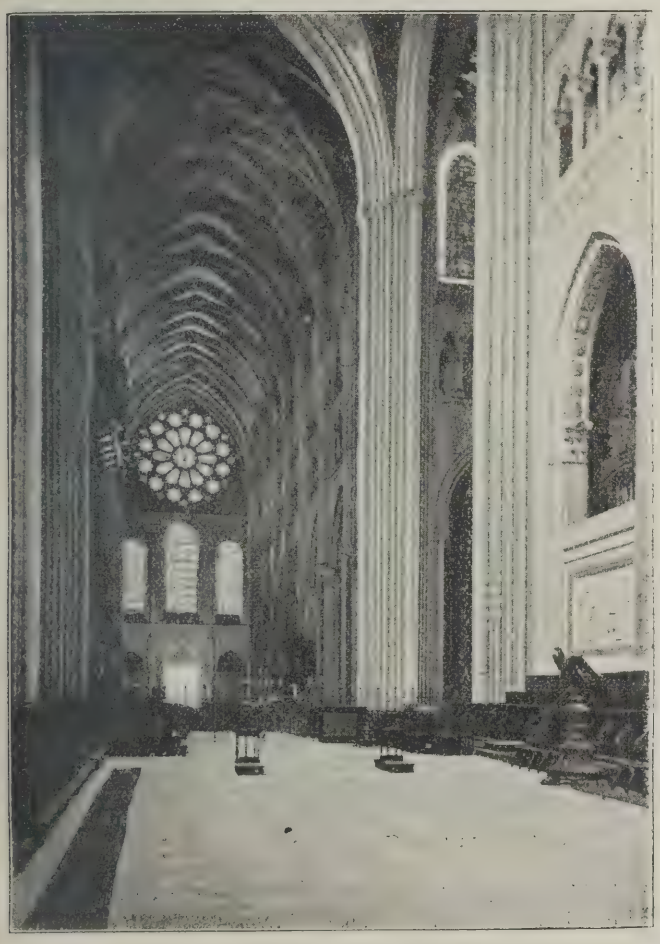
This illustration shows the new front to existing premises as being carried out by the Bristol Corporation under their engineer, Mr. Thomas Henry Yabbicom, Assoc.M.Inst.C.E. The lower portion of the building from pavement-level to window-sill on first-floor is in Pennant stone from the Hanham Quarries, the remaining portion being in brickwork with Bath stone bands and dressings. The work is being carried out by Mr. William Church, contractor, of Bristol.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

(*Continued from page* 364.)

V.



Chartres.

NOTRE-DAME at Chartres being at once parochial and cathedral, there are two sung Masses on Sundays and all great feasts—the parish Mass at nine, and the chapter Mass, carried out with greater pomp and circumstance, preceded and followed by the Offices, at half-past ten. On the occasion of our visit the parochial one—a Missa Cantata, at which, however, incense is offered—presents but few features of interest to the ecclesiologist, ritual or musical. There is a tolerably large congregation, made up chiefly of women and children—as almost everywhere in France—a few men occupying stalls in the choir, the other parts of the cathedral most favoured at this Mass being the procession path commanding a view of the high altar and the nave in the immediate vicinity of the pulpit. At the sermon all those hitherto seated in and around the choir adjourn to the nave; some, bringing their chairs with them, dispose themselves about the centre alley of the nave, or as near the pulpit as they can get in the side aisles in a very picturesque and elastic manner. Opposite, in the *banc d'œuvre*, upon whose ledge two candles are burning on either side the crucifix, we find the celebrant and his assistants comfortably "y-park'd." Not only are the preliminary notices almost inaudible, but also the subsequent discourse, which, however, has the merit of brevity. So we give up the attempt to listen, and occupy ourselves with the extremely picturesque scene presented by the nave on this occasion—one which Prout or Wild would have loved to paint had they lived now instead of when they did. Dwelling upon the glorious old thirteenth-century windows,

> Each the bright gift of some mechanic guild,
> Who loved their city, and thought gold well spent
> To make her beautiful with piety,

but particularly upon the great south transept one, in which the four major Prophets appear, each bearing upon his shoulder a minor Prophet in very quaint fashion, we reflect upon the centuries of suns and storms which have successively glorified or expended their fury upon this marvellous wall of colour. Throughout the whole Office there is nothing but an uninterestingly monotonous plain song, without a single tune that one can catch and store in the memory ever after to afford relief. It is only on the great feasts that one hears a grand swinging melody such as the *Laudamus cum superis* on the Assumption. "Madame, à quelle heure commencent les offices capitulaires?" we ask of the old dame who is setting chairs straight at the conclusion of the parish Mass, an occupation in which this particular class of old Frenchwomen seems to pass a considerable portion of its existence. "A dix heures vingt, Monsieur," is the polite response. There is no time for a lengthy ramble about the city, so we sit about quietly under the trees in the precincts, and listen to the great bells "banging," for the French have no idea of chiming and ringing, or stand—

> Before the triple northern port,*
> Where dedicated shapes of saints and kings,
> Stern faces bleared with immemorial watch,
> Looked down, benignly grave, and seemed to say,
> "Ye come and go incessant; we remain
> Safe in the hallowed quiets of the past;
> Be reverent, ye who flit and are forgot,
> Of faith so nobly realised as this."

Chartres Cathedral: the Choir, looking West.

Chartres Cathedral: portion of Screen round Choir.

Already those who are to take part in it are dropping into their appointed places for the great Office of the day. First, "les enfants du chœur" in scarlet cassocks, lace surplices

* In his lecture on the thirteenth-century architecture of France, delivered February 28, 1881, to the students of the Royal Academy, the late G. E. Street descanted enthusiastically upon these great transeptal porches at Chartres, in which the architect "has shown such a mastery over delicate detail as has seldom been seen, and this with an originality of design and a fertility of invention which cannot be too much praised. Both porches are generally similar in outline, but extremely different in the detail of their planning, which, in the case of the northern one, is very varied and beautiful. . . . It is as if the architect had felt himself tied and bound in his scheme for the church, and found himself breathing freely again when he had to complete the porches." The three western doors, or Port Royale, have seldom been excelled for the finished beauty of their workmanship. They are

confined at the waist by a pink sash, scarlet skull caps and slippers, file slowly in with folded arms by the gate on the south side of the sanctuary. Forming in a double line before the high altar, they make a most profound genuflexion—indeed, the "bowings and scrapings" all day at Chartres, from the most juvenile choir boy to the most venerable canon, were simply perfection. Some short devotions concluded, at a given signal they rise, face the west, bow to such of the cathedral dignitaries as are present, and proceed in single file to their deskless stools on either side of the choir. Anon the cantors, in black cassocks and ugly sleeveless surplices, arrive and take up their positions by the lecterns, on which rest the big noted books. Then a few more canons drop in, next a small procession of about a dozen seminarists; the organist takes his seat, strikes a keynote on the *orgue d'accompagnement*, and off they all start upon Terce, with the *Pater Noster, Ave Maria, Deus in adjutorium*, and the sublime Office hymn, *Nunc sancte nobis Spiritus*. The choir organ is silent during the long Psalms, but at the versicles following the Capitulum proper for the Transfiguration (*Salvatorem expectamus*, &c.), and while the six great candles are being lighted, it accompanies a boy whose limpid soprano voice rings through the vast building with an effect most thrilling because so unexpected. *Gloriosus apparuisti in conspectu Domini, Alleluia! Alleluia! Alleluia!* sings the boy to the *Jam lucis*—that loveliest of plain-song melodies. *Gloriosus apparuisti* is then repeated by the whole choir, accompanied by both organs. Again the clear soprano is heard alone, singing *Proptera decorem induit te Dominus, Alleluia! Alleluia! Alleluia!* *Gloria Patri* follows from the same boyish treble to another touching melody. The whole choir unite again in the *Gloriosus apparuisti*. Once more the solo breaks forth, *Gloria et honore coronasti eum, Alleluia!* to which the whole chorus answers *Et constituisti eum super opera manuum tuarum, Alleluia!* Amid this last grand burst of melody the officiant and his assistant ministers, in gorgeous vestments of white and gold, sweep in from the sacristy, the choir rulers, in copes, take their places at the lectern in the centre of the choir, and the chapter Mass begins with the "Asperges," sung as we have rarely heard it sung before. On this occasion the congregation under the crossing, though by no means vast, is larger than at the parish Mass, and, we may add, a thought more *à la mode*. Papa, mamma and two boys enter by the south transept door. Mamma takes the boys *chapeaux de paille* and her seat in front of the choir gate; the boys follow papa into the north choir aisle, as we thought, to pay devotions to the Black Virgin; but no, they reappear presently, aforesaid papa in cassock and surplice, and bearing a trumpet, the two boys with him, and so they all go into the choir, evidently to the no small pride and gratification of the juveniles. A few people of the *ouvrier* class are lounging over the wooden partitions thrown across the transepts, and people whose dust-covered boots proclaim that they have tramped in from the country are circulating in the choir aisles the whole time; but generally speaking they behave with reverence, and perhaps derive more scriptural knowledge from the glorious old glass and the matchless parcloses than from the elaborate music and ritual now going on in the choir. While the Kyries are being sung to one of the plain-song arrangements of Dumont, with loud and somewhat harsh interludes between each from the great organ pendant above our heads, in the last bay of the nave, two damsels, in dresses really so very boufféed that we tremble for the propriety of their appearance, enter the choir, preceding the pain bénit, with tall lighted candles. However, all passes off with the greatest decorum; the bread, looking like a small Tower of Babel, is carried by two red cassocked and surpliced youths on a species of litter, and having been placed upon a toilet-table like credence, the damsels, doubtless proud as peacocks at the important part they have borne in the ceremonies of the day, retire into the bosom of their family circle. The officiants again advance to the altar, "Gloria in Excelsis" is sung, and then follows the Collect for the day, the Epistle being read from a lectern "in medio chori." During the singing of the Gradual this piece of furniture is moved towards the entrance to the choir (facing north) for the singing of the Gospel, one of the most imposing features of the service, accompanied by the lights, and with the incense rising in a column before the old painted windows. The Credo follows, and then comes the Offertorium. Much happens at this point. We dive into our pockets for the sous requisite to satisfy the demands of the aforesaid old dame for our appropriation of a chair. On this occasion it is, "Dix centimes, s'il vous plaît, monsieur; vous avez aussi un prie-dieu." Dix centimes! It is worth a franc at least. Anon come the canons on their eleemosynary round, when our addition of a small silver piece to the rich vein of copper already lining the interior of the alms-bag evokes the sweetest of smiles, the politest of bows, and a "Merci bien, monsieur." The next excitement is the distribution of the pain bénit, handed round by a capped and gowned verger, followed by a rather sulky-looking chorister, forming a procession of two. We all take a small piece. Some, we observe, eat it at once, first crossing themselves with it; others place it on the chair-ledge in front of them to take home afterwards, but for some occult reason the unfortunates in the nave behind the barrier get none at all, upon which the faces of some juveniles who have been

Chartres: the Cathedral from the Basse Ville.

looking most anxiously for the advent of the basket, and hoping that it may reach them, fall several degrees. All this time the great nave organ plays a very quiet Offertorium, during which we have leisure to glance round us. Again the nave, looking westward, wears a most picturesque aspect. Several of the front rows of chairs are occupied by religieuses in tall white caps. One aged sister particularly attracts our attention by the way in which she follows the solemn music and ritual. Her face might be that of a Mater Dolorosa or St. Anna; it has a history in itself. Poor old thing! Perhaps her only comfort is this glorious building and its services.

Except at the commencement of the canon, the congregation remain seated. Kneeling at the Incarnatus in the Credo is far from general, nor is there anything approaching congregational singing. You hear a faint chirping every now and then from some ladies, but anything like our hearty mode of joining in the various items of the service does not seem to be thought of. Mass concluded, a grand rush takes place to-

quite a hundred years older than the transeptal porches, and as specimens of richest Romanesque may be compared with the north and south doorways at Bourges, the south door of the nave at Le Mans and one in St. Benigne at Dijon.

the chapel of Notre-Dame du Pilier. Here is quite a long queue of women, many of them holding babies, awaiting their turn to kiss its pedestal. We remain to hear Sext, occupying a chair close to the low iron screen at the entrance to the choir, and where we are somewhat surprised at the presence of a fashionably-dressed lady and her little daughter—we say surprised because the chapter Offices are not attended by the laity. The object of Madame, who is stout and wears glasses, in attending this Office soon becomes apparent, for at its conclusion and while the five-and-thirty choristers are making their obeisance to the high altar, we hear her say, while adjusting the pince-nez to her nasal promontory, "Can you see him, Angélique?" Angélique, a sharp little girl of about ten years of age, "spots" the mysterious "him" after a short inspection. "There he is, mamma," she says, in a sort of stage whisper; "let us go round to the psallette* and catch him." So off they go. We go off too and get some *déjeuner*, for we feel a desire to fortify the inner man. Everybody goes off, and the vast church is left untenanted, save by the priest whose turn it is to guard the precious black image.

On our way to the afternoon Offices we encounter numbers of young girls in white dresses and diaphanous veils hurrying from various directions, in some instances accompanied by a *bonne*, towards the cathedral. For this being the first Sunday of the month, a solemn procession of members of the Confrèrie de la Sainte Vierge is to take place immediately after Benediction. Arrived at the cathedral we find the south aisle of the choir occupied by these girls, who, under the surveillance of several nuns, fill it with a billowy expanse of lawn-like purity. One young damsel is very late, and comes tripping across the transept quite on the "light fantastic" to some airy music at that moment proceeding from the great organ as one of the interludes to *Magnificat*. The congregation is not very large this afternoon, and some of the "enfants du chœur" have rather a post-prandial air about them; but the Offices, which embrace None, Vespers, Compline and Benediction, are all carried out with the same dignified ritual that accompanied the chapter Offices of the morning. The officiant and his assistants are all vested in copes, and the scene during the censing of the altar, clergy, choir and congregation at *Magnificat* is very impressive. Like most French choirs, that at Chartres is now only separated from the rest of the building by a low iron grille, so that all the various ceremonies are well seen from the nave. Shameful to relate, the Classic hand has been very heavily laid upon this part of the cathedral. For during the episcopate of Bishop Fleury (1746-80) its piers and arches were transmuted into a sort of Corinthian Renaissance of the Louis XV.-XVI. type under Le Sieur Louis, architect to the Duke of Orleans. Fortunately those portions facing the aisles have escaped this vandalism. Above the stalls on either side are solid walls built into the arcades, and backed in the choir aisles by the matchless sixteenth-century screens already alluded to. In the choir, these walls—enriched with large bas-reliefs, four on either side, ranging from the Conception of the Virgin to the Deposition of Nestorius at the Council of Ephesus in 431—are continued right round the apse behind the high altar, which, backed by a mountainous mass of sculpture—an Assumption—has its six tall candles arranged upon a gradine to the right and left of the table.

In making the circuit of the choir-aisles at Chartres an advancement in style is very perceptible. The foliaged ornament in the caps of the clustered piers supporting the main arches, as well as that of the cylindrical ones belonging to the eastern fringe of chapels, is characterised by greater delicacy; besides, the fenestration indicates this. Here, instead of single lancets, we find them coupled beneath a round discharging arch, with just a soupçon of tracery in the shape of a very small circle. This very exceptional case of finding the later and richer work in the eastern portion of a French cathedral is explained by the fact that after the fire in 1194, in which the nave had suffered less than the choir, attention was directed first of all to the rebuilding of the western portions, partly because there was much remaining which could be made use of, and partly because those portions which it was possible to use at once could be put in repair, leaving such as needed entire rebuilding to be done after, and if in the nave the work bears marks indicative of haste, it was the very pardonable fault of a city which could not endure to see its cathedral in ruins a day longer than was absolutely necessary.

(To be continued.)

* Song school.

THE LATE MR. HAMILTON BEATTIE.

THE announcement of the death of Mr. William Hamilton Beattie, architect, Edinburgh, will be received with surprise and regret, says the *Scotsman*, not only by his friends and acquaintances but by all with whom he had business relations. He had been in ordinary health, and on Tuesday in last week was at his office as usual, where, on his return from a business run to North Berwick, he spent some time in dictating instructions to one of his clerks. Shortly after half-past six he went home, and when sitting at dinner with his sister, suddenly raised his hand to his head and almost the same moment expired. The immediate cause of death is believed to have been the bursting of a blood-vessel in the brain. Mr. Hamilton Beattie came of a family the members of which have been builders and architects in Edinburgh for nearly half a century. He was a son of the late George Beattie, who first came into prominence in his profession by securing by competitive design the commission for the erection of the Craiglockhart Poorhouse, the adjudicator, it is interesting to recall, being the late Mr. Bryce. The designs, as is invariably the case in such competitions, were sent in under mottoes, and Mr. Beattie selected the appropriate inscription, "Comfort for the poor, with care for the ratepayers." In the carrying-out of those plans Mr. Hamilton Beattie was associated with his father, and from that time dated his first entry into the firm. Since then he has accomplished an immense amount of work, and many monuments of his architectural skill remain to adorn the streets of the capital. A man of most exceptional industry, ceaseless energy and constant activity, Mr. Hamilton Beattie very seldom laid aside the carès of business, and those who knew him best incline to the belief that he took far too much out of himself in connection with business matters. In later years his services have been much sought after as an expert and skilled witness in connection with local and Parliamentary inquiries and valuations, and he proved so strong a man in this capacity that he came to be looked upon as indispensable in a reference of any consequence. It was largely due to him that the Caledonian underground railway scheme was thrown out by the Parliamentary committee. In all questions of compensation arising in arbitrations, as well as in all matters of valuation of properties, his ability and experience were unique, and, gifted with an exceedingly retentive memory, he was able to furnish from recollection references which at a moment's notice might be demanded. Coupled with this, he had such a clear grasp of the intricate legal principles involved in compensation cases as made him invaluable when important matters were under dispute. He has been the chief expert adviser to the city of Edinburgh all through the North Bridge Street arbitration, and only three days before his death he was engaged for several hours giving evidence in one of these cases. When the discrepancy in the figures of the proposed Usher Hall sites was discovered a few weeks ago, he was called in to make an independent valuation, and mainly owing to the statement he laid before the Council, the High Street site, which previously had been greatly favoured, was set aside. But these are only some of the more recent cases in which he was employed. For many years he undertook similarly important duties, not only for the Corporation, but for the North British Railway Company, who engaged him as their chief adviser in numerous arbitrations. His attainments were varied; a remarkable feature in his character was the facility with which he could acquire knowledge on a new subject, and could make himself acquainted, for instance, with scientific facts which had a particular bearing on any case he might happen to have on hand. His power to concentrate his mind upon the business he had on hand, his ability to adapt himself with readiness to any special set of circumstances, his untiring diligence and never failing application, and his consistent courtesy made him a very successful man of business. As an architect devoid of "fads," and with a sound commercial understanding of his business, he held a high position in the country. On Princes Street there are several notable examples of his work, among which it is only necessary to mention the Royal Hotel, the Clarendon Hotel, the Central Hotel, Charles Jenner & Company's handsome pile of buildings, and the new North British Station Hotel, in process of erection. He was also architect for the northmost section of the new Commercial Bank Buildings in North Bridge Street, and his elevations for the blocks to be erected by Mr. White, the builder, on the same side of the street, shown for the first time in the Council Chamber on the day of his death, drew forth the admiration of the Corporation. The Royal Insurance Buildings, George Street, the Imperial Hotel in

Market Street, the Marine Hotel, North Berwick, and Pattison's bonded stores at Bonnington were built from his designs, and the Waterloo Hotel has been reconstructed as railway company offices from his plans. Now that a system of cable traction is being carried out through the city, it is interesting to recall that it was largely owing to Mr. Hamilton Beattie the cable system was first introduced into Edinburgh, for he was not only the engineer of the first line to Goldenacre, but he, along with Mr. Mann, S.S.C., was the original promoter of the company. Mr. Hamilton Beattie, who was fifty-five years of age, was a widower. He leaves one son, who is at present at Rugby.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE annual general meeting of the Society was held on the 30th ult., Reginald Macleod, C.B., in the chair. Before proceeding to the ordinary business of the meeting, Sir Arthur Mitchell, referring to the recent decease of Mr. J. R. Findlay, said he believed he was safe in assuming that the thoughts of every one present turned to the loss which had recently fallen on the Society through the death of Mr. John Ritchie Findlay, and he hoped they would allow him, before they proceeded to the transaction of business, to attempt to give expression to those sorrowful thoughts. Mr. Findlay's connection with the Society was long and close, and it had more sides than one. On every side, however, he stood always before them as a most loyal and useful friend. Perhaps the chief work of the Society lay in its efforts to add to the knowledge of the unwritten history of Scotland, and in that direction, though Mr. Findlay did not himself to any large extent make contributions of original research, he was constantly stimulating and helping others in such work, not only by a deep interest in what they were doing, but also by intelligent criticism and wise counsel. Being an office-bearer continuously for a quarter of a century, he had a full and minute knowledge of all the more important work that was proposed or undertaken by the Fellows. He was elected a member of the Council in 1872, and remained a member till his death, filling various offices in the course of that period. For six years from 1882 to 1888 he acted as secretary, and he was twice vice-president, first from 1878 to 1880, and again from 1888 to 1890. From 1891 he held his place on the Council as a representative of the Board of Manufactures. The executive and purchase committees never had a more active and valuable member. In all these positions he showed a zeal for the prosperity of the Society, and greatly aided in securing it by his sagacious advice and by the exceptional power he possessed of stating a case in a clear, convincing and forcible manner. All that, or much of it, might possibly be said of other Fellows of the Society; but Mr. Findlay was able in a special way to prove his interest and friendliness. He had wealth. He might have had that without evidence of it in the progress of the Society. But he had more than the mere possession of wealth. He had the power of giving it away—of spending it on objects which he thought good. By splendid gifts he brought into existence institutions of a national character which helped to give to Scotland—the country he loved so well—a fitting place in our Empire, and which would send on his name with gratitude as well as honour to future generations. A leading motive in much of his public generosity seemed to have been the desire to supply to students of the history and pre-history of Scotland what might be useful to them. They owed it to his munificence that they met in that spacious and well-furnished library, and that their great national collection of antiquities was so fitly accommodated there for public exhibition. It seemed to him that the first act of a new session should be a request to the secretaries to prepare a statement showing how deeply they felt their loss, to be entered in the minutes and to be transmitted to Mrs. Findlay and her family, with an expression of their warmest sympathy. But he had a further suggestion to make. He thought it would give real pleasure to all of them if they had as a frontispiece to the next volume of the "Proceedings" of the Society a well-executed engraved portrait of Mr. Findlay, which the Board of Manufactures might allow them to take from the painting about to be placed in the Scottish National Portrait Gallery. Distinguished Fellows and benefactors of the Society had thus appeared in former volumes, and if effect was given to his suggestion, each of them would possess a portrait of the Society's best friend, to be a reminder of his all-round generous and liberal nature, of his great benefactions to the nation, of his sagacity, directness and courage, of his shrewd, witty and scholarly utterances—never unkind—and of his large-hearted hospitality. He ventured to ask that meeting of the Society—the first which had taken place since Mr. Findlay's death—to give their approval to the suggestions he had made.

The Chairman expressed his cordial concurrence in the terms in which Sir Arthur Mitchell had referred to the loss the Society had sustained in the recent death of Mr. John Ritchie Findlay, and the meeting unanimously agreed to adopt the suggestions made.

Among other business, the election of office-bearers for the ensuing year was made as follows:—President, the Marquis of Lothian; vice-presidents, Major-General Sir Robert Murdoch Smith, the Hon. John Abercromby and the Hon. Hew Hamilton Dalrymple; councillors, Sir George Reid and Sir Arthur Mitchell representing the Board of Trustees; Gilbert Goudie, Reginald Macleod, Sir Herbert Maxwell, John Horne Stevenson, Alexander J. S. Brook, J. Balfour Paul and John Findlay; secretaries, D. Christison, M.D., and Robert Munro, M.D.; foreign secretaries, Thomas Graves Law, LL.D., and James Macdonald, LL.D.; treasurer, James Henry Cunningham; curators of the museum, Robert Carfrae and Professor Duns; curator of coins, Adam B. Richardson; and librarian, James Curle, jun.

DEMOLITIONS AT FLORENCE.

THE following memorial has just been addressed to the Marchese Torrigiani, syndic of the city of Florence, in reference to the extensive demolitions which the municipality are understood to contemplate in the quarter of the city between the Piazza Vittorio Emanuele and the Ponte Vecchio. An influential and distinguished Florentine committee, with Prince Corsini at its head, has been working for some time past in order to obtain a reconsideration of the scheme; and it is not with any gratuitous purpose of interference, but in order to support the efforts of this committee, that the memorialists have ventured to make their appeals:—

"To the Marchese Torrigiani, syndic of Florence, &c.

"We are informed that the proposed continuation of the Via Pellicceria from the Piazza Vittorio Emanuele to the Ponte Vecchio involves the immediate destruction of the Palazzo Canacci and Giandonati, and of the other ancient houses in the Piazza di San Biagio; and that the prosecution of the scheme will entail the destruction not only of the church of San Biagio itself, but also of the 'Residenza' of the Arte della Seta, and a large portion of the Palazzo di Parte Guelfa.

"We ask to be allowed to draw your attention to the inestimable artistic and historic value of these buildings. The Palazzo Canacci and Giandonati is an admirable example of a Florentine palace in the style of the earlier Renaissance, with a well-preserved façade covered with 'sgraffiti,' and surmounted by a loggia. The group of buildings comprising the Gothic church of San Biagio, the Palazzo di Parte Guelfa with its hall and ceiling, the work of Filippo Brunellesco, the Arte della Seta with its fine Donatellesque relief of the arms of the Guild, and its charming loggia of Vasari, forms one of the historic monuments of Florence; their beauty and significance are known and esteemed by every student and lover of her arts and history. We venture to protest in the most emphatic manner against the irreparable injury which is threatened by the proposed demolition of these buildings to a city whose annals and monuments are of so much more than local interest.

"The scheme for the continuation of the Via Pellicceria further involves the demolition of the Palazzo Baldovinetti, the ancestral house of the great painter, Alessio Baldovinetti, the tower of which is one of the best preserved in Florence, of the greater part of the ancient Via Por Santa Maria, and of the remarkable early towers adjoining the Ponte Vecchio. The construction of an unsightly and ill-placed piazza in front of the church of Santa Stefano, and the formation of a new street from the Piazza della Signoria to the Ponte Vecchio, will sweep away other historic houses, including the Palazzo Bartolommei; and the continuation of the Via Vaccherecia to the Piazza di Santa Trinità will make away with the ancient Via della Terme. One of the oldest, the most historic and most picturesque quarters of Florence, which has hitherto remained untouched, will thus be completely destroyed; and not a few vestiges of a part of the city which Dante knew, and to which he alludes in the 'Inferno,' xiii. 144, will vanish. We cannot but apprehend that this wholesale demolition may prove the preliminary step towards the destruction of the Ponte Vecchio itself and the ancient houses in the Via de' Bardi and the Borgo San Jacopo, beyond the Arno.

"The unsanitary conditions which led to the demolition of the Mercato Vecchio cannot, we believe, be brought forward as a reason for pulling down the buildings in question; nor do we think that any interests of the city can be advanced by destroying those very monuments which make Florence a centre of attraction to the whole civilised world.

"We have the honour to be, &c."

Here follow the signatures, among others, of the Earl of Carlisle, chairman of the Board of Trustees of the National Gallery; Sir Edward Poynter, president of the Royal Academy and director of the National Gallery; Mr. George Aitchison, R.A., president of the Royal Institute of British Architects; Mr. Walter Crane, principal of the Royal College of Art and president of the Arts and Crafts Exhibition Society; Sir W. B.

Richmond and Mr. Alma-Tadema, Royal Academicians; Mr. G. F. Watts, Mr. Holman Hunt, Mr. Claude Phillips, keepers of the Wallace Collection; Mr. Stirling, &c.

SOME PECULIARITIES OF WOOD.*

THE most noteworthy peculiarity of wood is that this material, which has been so universally employed since the dawn of civilisation, is still so little understood, so imperfectly known as to its nature, characteristics and properties.

While the specifications for iron and steel materials have been developed to such finesse that even the chemical composition is prescribed as determinative of the quality desired, it is questionable whether the majority of engineers and architects know what points to make in the specifications for wood materials, and from the many inquiries the writer has received while in charge of the timber-physics work of the U.S. Division of Forestry, it would appear that they are not prepared to inspect the material which they have specified.

The reasons for this absence of knowledge and finesse in the use of wood are probably two: wood has been apparently plentiful and cheap, hence not calling for a more economical and effective use; and, furthermore, being a very non-homogeneous and variable material, or rather, structure, the precise study of its properties and characteristics has been too difficult and cumbersome.

Yet it is possible to study wood in a scientific manner with the assurance of practical results, as has been shown by the extensive and fruitful series of studies which one wise administration of the U.S. Department of Agriculture authorised and another wise (?) administration discontinued just when most promising progress had become possible and the first important results had been announced. If no other fact of value for the practitioner had been obtained than the discovery that the "strength of a beam at the elastic limit is equal to the strength of the material in compression," the value of the work could not be denied, while as to the propriety of the Government undertaking the study of this difficult and complex subject there could be hardly any dissenting voice, especially when it is admitted that it is the function of the Government to secure a conservative policy in the treatment of our forest resources and presumably also of the material which this resource furnishes.

The defects in our knowledge regarding the peculiarities of wood lead naturally to a crude, improper or wasteful use of the material, which could be greatly improved even if only the existing knowledge were more closely applied. There is a possibility of specifying, selecting and inspecting wood materials which a knowing architect can now secure, thereby increasing the efficiency, durability and stability of the structure.

There are those who are inclined to think that there is no need of greater finesse in this direction, either because we have such an abundance of wood materials that their wasteful use will work no harm and need not be considered, or else that wood is destined to grow out of use and is bound to be supplanted by other materials.

The first position has been true enough for the past; but we are entering on any era when, through the wasteful exploitation of our forest resources, without attention to their reproduction, the abundance of good wood materials is bound sooner or later to cease, and the decrease in supplies will force upon us the necessity of greater economy.

The second position, namely, that wood will be displaced by substitutes is also true only in part. Since we are using only from three to ten times as much wood now as other civilised nations, undoubtedly the necessity of economy will force us to reduce our wood consumption and to substitute stone and iron, which in many cases will prove an advantage.

But he who thinks that wood at any time will be entirely or practically supplanted by other materials shows ignorance as to the true merits and characteristics of that material which is as much an indispensable requirement of our civilisation as our food materials.

What the lowest requirements of wood for high civilisation in the temperate zone of the world are may perhaps be learned from the consumption of such people as the Germans or British, the latter relying almost entirely upon importations; the former, in spite of their methodical treatment of their forest resources and their comparative poverty, were forced to import more than two thousand million feet B.M. above exports, in addition to their home production. The consumption of these people, being about one-quarter of our consumption, ranges between 150 and 160 feet B.M. of saw material per capita, which may be considered as expressing the absolute necessity of a modern settled civilisation without expansion, such as the unsettled condition of our country induces.

There are a number of characteristics of this material which make its continued use desirable. It would lead us too far to point them out in detail. Perhaps it is not realised that a beam of long-leaf pine will bear without detrimental deflection a load from six to eight times as great as an iron bar of the same length and weight, a cubic foot of iron weighing ten to thirteen times as much as a cubic foot of that wood and costing at least twenty times as much. That means the iron structure is at least twice as expensive. In the combination of light weight, stiffness, elasticity and strength with cheapness and ease of working wood excels all other materials and renders it especially invaluable in all rapid constructions. But the most valuable and unique feature of wood, which is undoubtedly unconsciously but yet not fully appreciated, is the fact that it is a poor conductor of heat and electricity. This property, if no other, will assure to this material a continuous use in the arts not only for utensils, furniture and finishings, but for construction in general, since a metal substitute, the only material we can think of, would not only bring discomforts, but dangers which the increase of electrical appliances would constantly multiply. Hence a better knowledge of wood leading to more effective use will remain desirable.

There are three properties peculiar to wood which make its use as a material of contruction appear objectionable, and it is these of which I wish mainly to speak—its liability to shrink and swell, its liability to rot, its liability to inflammation and combustion. All three of these defects can be, and at least invaluable permanent structures ought to be, overcome by proper selection, inspection and treatment of material.

The first two defects are due partly to the one and the same property of wood, namely, its high hygroscopicity, from 50 to sometimes over 150 per cent., related to dry wood, of the weight of a freshly-felled log in water. This is gradually lost in seasoning, but unless artificial means are applied this seasoning progresses rather slowly and with some species a "yard-dry" condition is not reached in years, if by "yard-dry" any definite stage of moisture condition is meant. The moisture contained in such "yard-dry" wood, in addition, is very unevenly distributed through the stick, and hence influences the behaviour of the stick unfavourably as regards swelling and shrinking.

As a matter of fact, wood is never entirely dry, even when artificially dried. As soon as it comes from the dry kiln thoroughly dried its high hygroscopicity asserts itself; it takes up water from the air more or less according to the relative humidity of the latter, so that even the best dried wood in use will contain at least 8 to 10 per cent. of moisture or even more. If left unprotected, unvarnished and unpainted, this percentage changes with the change in the atmosphere, and hence shrinking and swelling or "working" is the result.

This of course is known to all architects and woodworkers, but the effort to avoid this most troublesome peculiarity of wood does not appear to be always in due proportion to the knowledge.

There is of course a specification of "seasoned" material, but is there any attempt at defining what is the requirement of "seasoned" condition? And is there any inspection? If there were, fewer floor joints would open and more doors would shut snugly.

A single inspection test would be to cut a small piece from the middle of a floor board—the end would not do, as it is always the driest part—weighing it, placing it in an oven or other heater until it does not lose any more weight, when the difference between the first and last weight gives the weight of water lost; this divided by the first weight and multiplied by 100 gives the moisture per cent. of the wood. If it is greater than that specified, say 10 per cent. for the best work and 12 to 15 per cent. for cheaper constructions, there is cause for complaint and rejection is justified.

To be sure, it is better to specify so as to avoid the complaint as much as possible. Specify for kiln-dried material, which is preferable to yard-dried, because, as a rule, more evenly dried. For very valuable work immersion in water or steaming should be practised. Immersion in water, without in any way impairing the value of wood as building material or otherwise, seems to decrease the hygroscopicity of wood, upon which property the swelling and shrinking rests. The Japanese, excellent wood-workers, whose careful use of wood should be an example to us, practice this immersion in ponds to a large extent.

Another specification which reduces the factor of shrinkage is for quarter—or rift—sawed material, for it is peculiar to wood to shrink and swell, or "work," more in tangential direction than in any other. Longitudinal working is practically *nil*, but the shrinking in tangential direction, *i.e.* in direction of the annual ring, is at least 50 per cent. more than in the radial direction. This is due to the fact that the thick-walled summer wood of the annual ring, which on account of its thick walls takes up more water and shrinks or swells more

* A paper by Professor B. E. Fernow, Dean of the New York State College of Forestry and former chief of the Division of Forestry, United States Department of Agriculture, read at the thirty-second annual convention of the American Institute of Architects.

than the thin-walled spring wood, is in such position towards the latter that in expanding or contracting it carries the latter with it—the summer wood shrinkage per cent. prevails—and hence the "working" is more pronounced in such a bastard board than in a quarter—or rift—sawed board, which contains the summer wood in a position where it cannot affect the spring-wood shrinkage, and also in a more even, regular distribution of spring and summer wood, thus insuring a more even working along the whole face and hence no warping.

If immersion is advantageous in promoting thorough seasoning, reducing liability to swelling and shrinking, it is on that account also advantageous in reducing liability to rot, because by the immersion soluble materials which serve as food of some of the rot-fungi are leached out.

Where, however, the question of time is important, there are other processes which are expedient and effective in keeping out fungi, and indeed more so than mere immersion in water.

Some of these processes, as creosoting, treating with chloride of zinc or other mineral salts, are well known and practised in special engineering works, as in canal and railroad building. They are, however, rather expensive, and require a special plant, which, unless situated where the architect practises, would forbid their use.

But there is now coming to the front an effective, cheap and simple means of increasing the durability of wood; it is the application of heavy coal-tar oils, which go by the name of "carbolineum." There are various brands trying to establish themselves, but it is still questionable how far claims of superiority can be demonstrated, and especially when a higher price is also exacted for such claim, it will be well to inquire closely into the superior merits. This material can be applied with a brush or, better still, by immersing the wood in the hot liquid for some hours or days. It penetrates the wood to sufficient depth so as to protect it against moisture and the accompanying rot-fungi in such places as architects are likely to have to deal with. Three pounds to the hundred square feet, enough to be effective, would not, even at the unnecessarily high price asked for some brands, increase the cost of a building so as to prevent its application even in cheap structures.

Decay usually starts not in the heart, but in joints and points of contact, mortise holes, &c., where moisture collects and is not rapidly dried off. Hence contact surfaces, and especially all joists and timbers in contact with damp brick walls, mud sills and posts and material placed where a proper circulation of air cannot be had, and where painting after thorough seasoning is not practicable, should be protected for sanitary reasons as well as to secure stability and permanency. To be sure, there are other precautions, specifications and inspection which can be applied to reduce liability to rot.

The choice of species to be placed in such situations should be considered, to secure at least partial immunity from rot; the cedar tribe, with the redwood and bald cypress, seem especially capable of resisting rot for a long time. Oak and chestnut come next among the more common woods. It must, however, be understood that these, too, are liable to rot unless properly handled. If not properly seasoned before using they are as liable to decay as other species; if felled in summer, when temperature and moisture conditions are favourable and fungus spores seek a location, incipient rot may be more readily introduced; if painted while not thoroughly seasoned the protection intended for the wood becomes a protection to its enemies; bastard-cut faces are more apt to admit water readily and give lodging to fungus spores. Circulation or air which carries off moisture is one of the most effective precautions against decay.

Perhaps the most objectionable peculiarity or property of wood is its inflammability and liability to combustion. While no doubt a large part of the 150,000,000 dols. worth of property which is annually lost by fire in the United States owes its destruction to the excessive and careless use of this combustible material, it is not at all sure that not a very large per cent. of this loss can be avoided without discarding the otherwise so useful material.

It is well to know in this connection that the supposedly fireproof construction of iron and stone has, after all, proved itself in cases of fire in the contents of the building often more disastrous to the property than a properly designed wood-construction would have been; the heat of the fire warping the iron girders out of shape and causing the collapse of the entire building, while in the wood and stone structure the walls might have been left intact and the chances of success in subduing the fire by a good fire-department would have been greater.

But aside from the fireproof mill construction with wood which Mr. Edward Atkinson has been most instrumental in bringing about, there are means for reducing the danger from fire in structures of a simple nature applicable to even the cheapest buildings.

The possibility of "fireproofing" wood is so well established that it is unnecessary to risk the hazards of construction with untreated material.

I do not mean to say that an "absolutely fireproof" building can be constructed with wood, or, indeed, with any material. The attempts in securing such have been and will probably remain futile. All we can expect to attain, just as with resistance to decay, is a degree of retardation, which is sufficient for most cases; "fire-retardent" rather than "fireproof" construction should be the aim. If we are satisfied to reduce the danger and merely delay the conflagration until a fire-department can arrive and prevent its spread, the problem can be solved by reducing the inflammability of wood without securing absolute incombustibility.

There are a number of substances which have proved themselves efficient fire-retardents, some of which can be cheaply enough secured to make their application practically and universally possible.

We find that, while untreated wood took fire under the conditions of the experiment undertaken at the instance of the Belgian Government at the end of one and three-quarter minutes, wood treated with water-glass or lime, or with ammonium phosphate or various ammonium salts, resisted inflammation from thirty to forty minutes, while other substances produce less resistance; the ammonium phosphate being the most efficient, acting by the production of a non-combustible vapour. If applied so as to fully impregnate the wood this would prove rather expensive, as 100 lbs. costs 25 dols., and would not saturate more than 25 cubic feet. But there is no need of a thorough impregnation, especially when one of the cheaper protective coatings of asbestos in water-glass, &c. (which are efficient by being poor conductors of heat) are used in addition.

It must not be forgotten that in the absence of encouragement cheaper methods and materials are slow in being brought forward. There are even now cheap antipyreas to be had, like calcium chloride and ammonium chloride, which, though less effective, would greatly decrease the liability to conflagration.

Finally, it may be of interest that a generous application of silicious compositions to all exposed woodwork has been so effective in reducing fire danger in England as to cause a decrease of 50 per cent. in the insurance rates on houses thus treated.

The architect is, we believe, now in the position of bringing into the home he has built "that peaceful security and liberation from a dreaded tax which comes with the practical abolition of danger from conflagration." When due attention is given to making buildings fireproof and rotproof, not only safer, more durable and more sanitary buildings will result, but in the end they will be cheapened more satisfactorily to the investor.

As Mr. Constable has pointed out before the Boston Society of Architects, failure to secure satisfactory results comes often from the incomplete attention to all points of the problem of successful fire-retardent construction, an absence of consistency in plans and execution. Hence the progress of reform is retarded.

I am inclined to think that 20 to 50 per cent. more efficiency can be secured in the use of wood materials than is now obtained by merely applying the knowledge now in existence.

In order to give some practical point to these few hints of reform, I would suggest that if your Society is organised not only for exchange of views and facts relating to your art, but also for its advancement, a committee to study and report on specifications for wood materials so as to at least reduce as far as possible the dangers from rot and fire would be a most laudable direction of associated effort.

THE OLD BRIDGE AT LUCERNE.

IT is almost inconceivable, writes a correspondent of the *Manchester Guardian*, that the authorities of Lucerne should be so short-sighted as to allow anything to interfere with the wooden bridge known as the Kapell-Brücke. Built in 1333, and entirely constructed of wood, it is one of those monuments of a bygone past that cannot be allowed to pass away from Europe without a protest. Not only does it remind us of the time when so much of Lucerne within the walls, either of the old or the new town, was built of wood, that men called Lucerne the "wooden stork's nest," but it tells us of a time when men felt that a nation was kept strong by reverence for the heroic deeds of the past, and none who passed that bridge in the olden days but felt the breath of battle for the Fatherland, or the glory of marytyrdom for God and for faith strengthen their souls. It was not without good intent that the Switzers of old time painted in the 121 triangular spaces beneath the tie-beams the sufferings of their patron saints Leodegar and Maurice, the deeds of might of Winkelreid or the hero of the battle of Giornico. It was with good purpose that for those who entered the "greater town" from the Klein-stadt beyond the river there should be set upon the wall at the Kapell-Brücke end the face and form of the hermit "Wanderfluh."

The fact seems to be that the burghers of Lucerne do not really seem to know what it is the average tourist comes to their beautiful town for. Their official guide-book, after telling us that 200,000 travellers pass through Lucerne in a season, asserts that "in a town where the present is so beautiful we may well let the past be forgotten," but a very large number of these 200,000 birds of passage alight at Lucerne just because they cannot let the past be forgotten, and are so tired of this modern life that they wish to get a glimpse of the more restful and more beautiful days of the fifteenth and sixteenth centuries. It is just because they wish to learn and dream of those old days beside the Reuss that they care so much for all that helps their power to dream of bygone days, that they delight in the Spreuer-Brücke and the quaint pictures of the Dance of Death that Gaspar Meglinger drew, that they gaze again and again upon the quaint brown-hooded Wasser-Thurm and the crooked Kapell-Brücke, that their eyes wander away from the palatial hotels and modern promenade beside the lake foreshore to the Musegg and its crown of towers, and let their eyes by irresistible attraction rest on the Rathhaus tower, and forget the brand-new station and the princely post office. If only Lucerne knew its attractions it would preserve them.

But, notwithstanding all the good work that the genius of the art school, Professor Weingartner, has done in the past ten years to bring back the times of Holbein and to redecorate the outside walls of the shops and hotels in the older part of Lucerne with interesting fresco-painting, it would appear that the genuine feeling for Old Lucerne is dead or dying, and we hear with feelings of regret that will be shared by the whole world of travellers that the Kapell-Brücke is doomed. Last summer a portion of it was taken down to make way for a new riverside street, and, however much it pained one to see the change, one felt that the interests of the marketers had due right to consideration. But to destroy history and desecrate tradition, as is now proposed by the removal of the whole bridge, is vandalism as stupid as it is shortsighted. If greater facilities must be given for passengers across the Reuss, let another bridge be built, though every bridge so built will make the river Reuss less of interest to the artist than it now is. But in the name of common sense let the burghers see to it that they do not kill the goose that lays the golden eggs. Thirteen towers and gates have thus been destroyed in the name of facilities for visitors and improvement of traffic since 1833. Had they been standing to-day the city would have been as unique as Rottenburg for untouched Mediæval remains, and each year would have added to the wealth of the coffers of those who cater for the tourist public. But the spirit is still alive that for ever ruined the artistic glory of the river near the Spreuer-Brücke when it wiped out the ancient buildings and replaced them with a fine red-brick and Welsh-slated factory.

TESSERÆ.

Obstacles to Art in England.

FOR the attainment of excellence in the higher branches of art, as has been well observed by Passavant, it is requisite that a people should possess deep poetic feeling, and that art should not be considered among them as a thing of separate nature, but that it should interweave itself with the ties of social life, and be employed in adding beauty to its nearest, dearest interests. Now, the English, he continues, are more disposed to an active than to a contemplative life. They possess, it must be owned, a character of much earnestness and energy; yet, from the earliest times, their attention has been more directed to the cultivation of the mechanical arts and the sciences appertaining to them than to those nobler branches of art which flourish spontaneously in a more contemplative nation. This characteristic disposition, and the physical activity necessarily connected with it, have been by some ascribed to the influence of our climate, to our moist and heavy atmosphere and clouded skies, to counteract the influence of which, and to preserve a counterbalancing buoyancy of mind and body an active habit of life is requisite. But this hypothesis is untenable; for Flanders, with a similar climate, and flourishing likewise by means of its native industry, affords sufficient proof how little these circumstances are prejudicial to the cultivation of the fine arts. Perhaps a better reason may be found in the wide difference which is observable between the national habits of our countrymen and those of the people among whom the arts have been cultivated with the greatest success. In those countries where the beautiful was felt, where the arts were objects of national importance, where a people assembled to award the palm between rival sculptors, and also, in comparatively modern times, when a reigning monarch did not disdain to pick up a painter's pencil, and a whole city mourned an artist's death and paid honours to his remains, all the rank, wealth, genius, talent, taste and intelligence of the people were concentrated in one grand focus. Among the states of ancient Greece and modern Italy the city was, in fact, the nation; and at Athens, Rome, Venice and Florence was collected all of genius, taste and talent the people as a body possessed. The mental qualities were thereby rendered more acute, and the tastes and manners of the people more refined and cultivated by constant intercourse and communication with each other. This refinement was shared by all classes, and the lower taking pattern from the higher, the whole mass was learned. In England the very reverse of this takes place. Here, for the most part, those alone frequent our towns whose doom it is to labour for their bread; they have no leisure from the engrossing pursuits of wealth; business, like a jealous mistress, leaves them no time for other objects. In spite of various disadvantages of soil and climate, the taste for rural pursuits seems part and parcel of our nature, and that species of the genus homo, the country gentleman, seems peculiar to our island. Till within a few years the great majority of this class, whose abundant wealth and leisure might seem to constitute them the peculiar patrons of the arts, seldom or never frequented even the Metropolis, but for generations remained fixed and immovable in the place of their forefathers, rooted to the soil as one of their old oaks.

Perpendicular Characteristics.

Arches at first enclosing an equilateral triangle, afterwards obtusely pointed. Piers generally oblong; longitudinal direction, north and south. Mouldings continued from base through arch; capitals with mouldings, large, angular and few, with abacus and bell imperfectly defined. Foliage of conventional character, shallow and square in outline. Bases with bead, reversed ogee and hollow, polygonal. Windows, when lofty, divided into storeys, by transoms; the mullions often continued perpendicularly into the head. Canopies of ogee character richly crocketed. Doors generally with square label over arch, the spandrels filled with ornament. Buttresses with bold projection, often ending with pinnacles. Flying buttresses pierced with tracery. Walls profusely ornamented with panelling. Parapets embattled and panelled. Open timber roofs of moderate pitch, of elaborate construction, often with hammer-beams, richly ornamented with moulded timbers, carved figures of angels, and with pierced tracery in spandrels. Roofs sometimes of very flat pitch. Lofty clerestories. Fonts raised on steps, octagonal in shape, with sculptured panels of tracery and figures. Elaborate font covers. Mouldings large and coarse, with wide and shallow hollows and hard wiry edges, meagre in appearance, and wanting in minute and delicate detail; generally arranged in chamfer planes. Early in the style the mouldings partake of Decorated character.

The Cathedral of Lausanne.

The cathedral of Lausanne rejoices in the renown of being the finest in Switzerland, a distinction it has every appearance of deserving. Like most of our English minsters, it is surrounded by a claustrum or close, composed chiefly of very picturesque turreted piles, grey ramparts and aged gardens, now a wilderness of fruit trees. Before its western front extends a stately terrace of chestnut trees, overlooking literally the steep housetops, the lacquered minarets, louvres and gourd shaped domes of the collegiate, palatial and municipal buildings, and confronting even the fine belfroy windows of St. François itself. Simple even to severity, the cathedral of Notre-Dame exhibits every variegation of the Lanceolate style, and from this, with only two exceptions, it never departs; for while in the southern porch it is evidently flirting with the Decorated style, in the great western door and window—witness the foliated tracery and the ogee canopy—it has absolutely revolted to that most gorgeous and elegant order. The glory of the pile is, however, the southern porch, whether we regard its grand proportions, its beautiful figure, three sharp gables with bold trefoils flanked with tall voluted columns and clustered in the centre of their steep roof into a graceful minaret, or the delicate luxuriance of its interior decorations, especially that triple arcade of disengaged pillars. Generally speaking, the exterior of the minster is plain and massive, and its extraordinary galleries of trefoiled and lanceolate apertures, enwreathing nave, choir and tower fail to redeem it from the imputations of heaviness. To this, with all its noble belfroy windows and its four picturesque turrets, the great western tower or campanile deplorably contributes; while on the central tower (not content with having stuck a scraggy spire about as suitable to its bulk as a fool's cap to the Farnese Hercules) they have, in order to deprive its deformity of the last chance of escaping notice, gilded the thing from its parapet to its weathercock. The interior is so nobly simple in its plan, and yet so incessantly variegated in its detail, the narrow lancet heads of the sweeping apsidal cloister are so graceful, the flat Romanesque arcades in its circular oriel are so curious, the galleries with their quatrefoil and trefoil apertures extending in every direction, even to the clerestory windows, at once so allure and divide the attention that we have to wait for a second gaze before recollecting sufficiently to lament the absence of that peacock imagery, the language, the very life of the Gothic

lattice which iconoclastic fury has banished from the temple. There is a superb marigold window, whose Geometrical tracery they have stuffed with the deep dyed purples and crimsons of the monastic laboratory—a monument of their own barbarism. Three lancets beneath are tinctured with modern colours—a monument of their own degeneracy.

The Society of Arts.

From a meeting of only eight persons at Rauthmell's coffee-house in Henrietta Street, Covent Garden, on March 22, 1754, this Society dates its origin. The energy of William Shipley struck the spark which raised it into life and action, and two noble peers, Lord Folkestone and Lord Romney, honoured it with their protection. The advantages of such an institution were immediately perceived by the public, and numerous members soon gave it that firm establishment which it has ever since so honourably maintained. Lord Folkestone and Lord Romney were successively presidents. William Shipley was honoured with the first gold medal, with this inscription, "Whose public spirit gave rise to the Society." Very many individuals were encouraged by the rewards of the Society, especially in its early days. Thus in the list of 1808 we find the following recipients :—Philip Hardwick, of Berners Street, for an original drawing of an academy of arts, being the premium given in conformity to the will of the late John Stock, of Hampstead, the gold medallion; Edward Blore, of Upper Titchfield Street, for an original drawing of Fotheringham Church, Northamptonshire, the silver medal; J. C. Bromley, of Brook Green, Hammersmith, for an etching of a landscape, figures and cattle, a copy, the larger silver palette; to Master William Ross (after Sir William Ross, R.A.), of Tavistock Street, for an original miniature painting of Venus and Cupid, the larger silver palette.

Temple and Grove of Daphne.

At the distance of five miles from Antioch, the Macedonian kings of Syria had consecrated to Apollo one of the most elegant places of devotion in the Pagan world. A magnificent temple rose in honour of the god of light, and his colossal figure almost filled the capacious sanctuary, which was enriched with gold and gems and adorned by the skill of the Grecian artists. The Deity was represented in a bending attitude, with a golden cup in his hand, pouring out a libation on the earth, as if he supplicated the venerable mother to give to his arms the cold and beauteous Daphne, for the spot was ennobled by fiction, and the fancy of the Syrian poets had transported the amorous tale from the banks of the Peneus to those of the Orontes. The ancient rites of Greece were imitated by the royal colony of Antioch. A stream of prophecy, which rivalled the truth and reputation of the Delphic oracle, flowed from the Castalian fountain of Daphne. In the adjacent fields a stadium was built by a special privilege, which had been purchased from Elis; the Olympic games were celebrated at the expense of the city, and a revenue of thirty thousand pounds sterling was annually applied to the public pleasures. The perpetual resort of pilgrims and spectators, insensibly formed in the neighbourhood of the temple the stately and populous village of Daphne, which emulated the splendour, without acquiring the title, of a provincial city. The temple and the village were deeply bosomed in a thick grove of laurels and cypresses, which reached as far as a circumference of ten miles, and formed in the most sultry summers a cool and impenetrable shade.

NATIONAL PHOTOGRAPHIC RECORD ASSOCIATION.

Under the auspices of this Association an address on "A National Photographic Record" was given in the Imperial Institute on Monday by Sir Benjamin Stone, M.P., the president. Captain Abney, director of the Science and Art Department, occupied the chair. Sir B. Stone, in the course of his address, said that what they had in view was the collection of photographic records of objects and scenes of interest throughout the British Isles. These records would be deposited in the British Museum, where they would be safely stored and be accessible to the public under proper regulations. Such a collection would not only possess a great interest for the public, but it would be almost invaluable for the historian. There must be in many parts of the country customs and habits and observances of which they possessed no pictorial representation whatever, and if these were photographed they would form most important material for, and it might be throw curious sidelights upon the social history of the people. Then, too, there were buildings, rooms and other places of high historical and literary interest and importance. Of many of these there were pictures in the possession of some one, but he knew from experience that pictures faded and perished; but now, thanks to the remarkable improvements in photography, they were able to produce records by processes of an absolute permanent character. The formation of a national photographic collection had, indeed, become almost an imperative duty, and they ought not to hesitate to adopt any means to secure it, even to the extent of setting up a Government department charged with the duty. Captain Abney, in thanking Sir B. Stone for his address, said he was rather surprised that the lecturer should recommend that work of this kind should be done by a Government department. When they had active and skilled amateurs like Sir B. Stone, a Government department, in his opinion, would be quite *de trop*. If such work were not done better, it would certainly be done much quicker by the amateur than by the Government department, and the less red-tape they had in this matter the better it would be for the object they had in view. He was speaking not as a Government official, but as a member of the Association, and he certainly did not want to be handed over to any Government department to prevent that freedom of action which was so characteristic of Englishmen when they were not tied up with red-tape.

GENERAL.

Sir E. J. Poynter, R.A., has been elected a correspondent of the French Academy of Fine Arts, in succession to the late Sir E. Burne-Jones.

Lord Iveagh has placed 1,000*l.* at the disposal of the authorities of St. Patrick's Cathedral, Dublin, to defray the expenses of preliminary investigations rendered necessary by a recent report from Messrs. Thompson, contractors, Peterborough, on the dangerous state of the towers and buttresses of the east end of the cathedral.

Mr. Charles J. McCarthy was on Tuesday re-elected city architect of Dublin for one year.

The Candidates for election to the Académie des Beaux-Arts are the following painters :—MM. Blanc, Cazin, Comerre, Cormon, Dagnan-Bouveret, François Flameng, Humbert, Lhermitte, Maignan, Roybet.

A Meeting was held lately in Cape Town in support of a project for a new cathedral. The site is to be one at present used for a school facing St. George's Street. The estimated cost is 150,000*l.*, or for the eastern part, which would first be built, 50,000*l.*

The Trustees of the Dysart Estates have agreed that the lands along the Thames are to remain unenclosed for all time from the existing fences. This secures to the public a strip several miles in length, extending from River Lane, at the foot of Richmond Hill, to the further side of Teddington Lock.

Memorials in support of the Italian Society in its protest against projected demolitions in Florence can be signed at the Kensington Town Hall; Mr. Grant Richards's office, Henrietta Street, Covent Garden; and Messrs. Jones & Evans, Queen Street, Cheapside, until December 20.

The Technical Education Board of the London County Council have drawn up a report for presentation to the Council, dealing with the desirability of the Board assuming responsibility for the science and art instruction within the county of London.

The Official Returns to the Wesleyan Methodist Missionary Society show that the estimated cost of repairing and replacing the damage done to the Connexional property by the hurricane in the island of St. Vincent alone amounts to 12,460*l.*

The Site now occupied by Lady Holles's schools in Redcross Street, E.C., is to be used for a station for the Metropolitan Fire Brigade.

The Prizes won by the students of the Royal Academy wil be distributed to-morrow evening at 9 P.M. The competition works can be seen by the public on Monday next.

The New Building of the London Library, St. James's Square, was formally opened on Monday. The architect is Mr. Osborne Smith.

M. Boutet de Monvel, the French painter, is about to visit the United States, where exhibitions of his works have been organised in several cities.

A Performance of "Gautier d'Aquitaine," the new opera of which M. Paul Vidal is the composer, will be given in the Paris Opera House on Wednesday next, and the receipts will be applied to the fund for the erection of the memorial of Charles Garnier.

The Following Candidates passed the final examination of the Royal Institute of British Architects, held in November :—Walter Hargreaves Bourne, John Cubbon, Leslie William Green, Frederick Robert Hiorns, John Kirkland, Edward Frost Knight, Ernest Jesse Mager, Harry Dighton Pearson, John Henry Arthur Phillips, George Reavell, jun., William Alphonsus Scott, Vincent Steadman, Henry Tanner, jun., Harry Inigo Triggs, Jasper Wager, Arthur Maryon Watson, B.A.Lond.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii

ELECTRIC NOTES.

THE Whitechapel District Board have adopted a scheme for electric lighting for the district, and decided to borrow 60,000*l.* for carrying out the first portion of the work, which is to be performed within two years.

AT a meeting of the electricity committee of Glasgow Corporation on Tuesday, a report was submitted by Mr. Chamen, the engineer of the department, and Mr. Myles, architect, on the proposed new electricity works at Coplawhill, on the south side of the city. The total cost for building and plant is estimated at 59,000*l.*, of which 16,000*l.* has already been authorised by the Corporation for the new generating station.

AN evidence of the progress of electric-lighting schemes is to be found in the figures just officially announced from the Private Bill Office of the House of Commons. Those which were submitted to Parliament last year numbered eighty-five—a great increase on the number put forward in the previous session. No fewer than 114 provisional orders have been deposited, and in addition to these there are several schemes for the production of electrical energy. Some of the latter proposals contemplate the supply of electricity to large districts. The proposals do not, however, deal exclusively with large centres of population, this form of energy for lighting and other purposes having become vastly popular in small urban districts.

IN a recent presidential address Mr. Preece mentioned the fact that there is enough energy "running to waste" in the waterfalls of the whole world to supply the wants of the whole of its industries; but at present very little of it can be practically utilised, from the unfortunate circumstance (which, however, is natural and explicable) that great centres of industry and great falls do not occur near each other. Generally speaking, the

distance to which power can be applied electrically is merely a question of money—that is, it does not pay to convey it far, compared with the cost of other sources of energy, such as coal. Rome at present obtains its light and runs its tramcars by means of electricity generated at Tivoli, fifteen miles away; Switzerland and South Africa use their falls and cataracts considerably, but it is in the United States that the idea has been most developed. In one town in Utah, for example, a voltage of 40,000 is produced, and the energy develops power equal to 2,000 horse-power thirty-two miles from its source; while at Ogden, Salt Lake City, the distance between the falls and the place where their energy is usefully employed is thirty-six miles. Of course we have nothing to compare with this in our own country, the electric railways at Portrush and Bessbrook in Ireland, and small undertakings at Worcester, Keswick, Lynton, &c., forming practically our only examples. This, however, arises not so much from our own backwardness as from the unalterable "nature of things."

BUILDING AND BUILDERS.

THE foundation-stone of a new schoolroom in connection with Llanaber church was laid on the 30th ult.

THE foundation-stone is to be laid to-day of the Whitechapel picture gallery, which is being erected adjoining the library in the High Street.

MESSRS. PEASE, extensive colliery owners and coke makers in Durham, have decided to erect handsome schools for the education of the children of their workpeople at Ushaw Moor. Accommodation will be provided for 600 scholars, and the cost of the premises will be about 5,000*l.*

A NEW pier is to be erected at Felixstowe, starting from the shops near the Old Battery and running out 3,300 feet. Upon the structure will be provided pavilions for concerts, refreshment-rooms, and hot and cold sea-water baths.

LLANDUDNO has resolved not to be behind in the supply of dramatic fare to its residents and visitors. Mr. Kitts, of the Sydenham Restaurant, has completed arrangements for the conversion of the newly-vacated St. George's Hall, in Mostyn Street, into a commodious theatre. Considerable additions will be made to the existing building with a view of providing accommodation for about 1,500 persons. A syndicate has also been formed for the purpose of erecting another theatre in the Craigydon part of the town, on land abutting on Riviere's Concert Hall.

THE memorial-stone of the new Hutchesontown, N.B., parish church, which is being erected at the north-west corner of Rose Street and Rutherglen Road, was laid on the 3rd inst. The church is designed in the Romanesque style, and is to be seated for 950 people. There is also a hall alongside to seat 600. The church has back and side galleries, with side aisles, and a special feature is an imposing chancel arch, suitable for an organ chamber, with the pulpit in front. The arch will have three relieving arches. The roof is an ingenious combination of iron and slate, and it covers the whole span, without any clerestory. The outside of the church is red sandstone, with rock-faced courses and clean dressed around the windows. The main entrance faces Rutherglen Road, and there are to be two side entrances. There is a tower at the west end of the main entrance, but there will be no spire. The architect is Mr. Alexander Adam, St. Vincent Street, Glasgow.

AS a development of the scheme for extending the Municipal Chambers in Edinburgh, the Lord Provost's committee of the Town Council have agreed to recommend the purchase of the Royal Exchange Hotel (better known as "John's Coffee House"), a room in which was at one time occupied by Hugh Miller when editing *The Witness*. Power to acquire this property and the adjacent shops to the east was taken by the Corporation in their Bill for enlarging the City Chambers. It is understood that the price to be paid for the premises, including the goodwill of the business, will be 15,000*l.* or 16,000*l.* This will give the Corporation command of the arches on the west side of the present entrance, and it is proposed in connection with this purchase to clear away the arcade and make a more worthy entrance to the City Chambers.

MR. F. H. TULLOCH, an inspector of the Local Government Board, held a public inquiry at the Board school, Curdworth, on the 1st inst., respecting the proposal of the Birmingham, Tame and Rea District Drainage Board to acquire a number of workmen's houses in the parishes of Curdworth and Sutton Coldfield, and their scheme for securing adequate accommodation for the persons inhabiting these houses. Under the Act governing the proceedings of the Board they may not, in acquiring land, compulsorily purchase more than ten houses

occupied by the labouring class without submitting a scheme of accommodation. The inquiry was attended by the chairman of the Drainage Board (Alderman Baker), the solicitor (Mr. E. O. Smith), the engineer (Mr. Knight), and the clerk (Mr. W. Harris). The solicitor explained that though the Board were acquiring forty-three houses, the population would not be displaced; in fact, they proposed to build fifteen other cottages and to convert some of the larger houses into cottages. If any of the tenants were disturbed there would be other houses provided for them. Mr. Knight submitted the plans of the proposed new cottages, which were to be erected on a site which the inspector had already visited. There was no opponent to the scheme, but a working man expressed satisfaction at the proposals of the Board. The inspector will doubtless report in favour of the scheme.

Owing to the continued encroachment of the sea between Herne Bay and Whitstable, causing continuous slips of valuable building land at Hampton, a survey of the coast has been made by experts, who express the opinion that the encroachment is entirely caused by the old pier. As property of great value is in danger of being swept away through the sea gaining on the land, it has been decided to demolish the pier immediately, this being the only means of saving the foreshore.

An arrangement has been made by which the private practice established in Manchester in 1850 by the late William Radford, Esq., M.Inst.C.E., and carried on until recently by him in conjunction with his son, Mr. William Harold Radford, under the style of Messrs. William Radford & Son, civil engineers, surveyors and valuers, at 19 Brazennose Street, Manchester, has been transferred to Mr. Joseph Swarbrick, Assoc.M.Inst.C.E., of Temple Chambers, 33 Brazennose Street, Manchester, consequent upon the appointment of Mr. W. H. Radford to the position of Bridgemaster for the county of Lancaster, in succession to his father.

TESTS OF BUILDING STONES.

In the Geological Report of the State of Indiana, the following directions are given for testing the quality of building stones:—

The elasticity of stone may be tested by sawing it into long slender strips, say 2 inches square and 3 feet long, when, if it be quite perceptibly flexible, its elasticity is good. If such a bar be suspended so as to hang free by a string and is struck a light blow with a hammer, its evenness and solidity of fibre will be attested by a clear, sweet metallic note, not unlike that of a fine bell or that of a well-tempered steel bar. As a rule the best stone will break with a direct line of fracture; but it may be conchoidal or otherwise indirect and still be unobjectionable. Parallel lines of cleavage or of stratification are always favourable indications where other features are promising.

Resistance to crushing weight may be pretty safely inferred from solidity of texture and evenness of grain; but it is always necessary before a final acceptance to submit the material to the severest tests of an apparatus for that purpose.

In examining sandstone, with a view to building purposes, the outcropping, if there be any, should be carefully scanned with a view to discovering what effect long exposure to the atmosphere and the rigours of winter may have had upon it. If the stone has "weathered" badly, this will be shown by one or another sign of disintegration or demolition, and a talus of fragments and sand will be found formed at or near the base of the outcropping cliff. Often the substance of the rock will show unmistakable evidence of inequalities of structural composition, such as horizontal cavities caused by the weathering out of seams or streaks that, on account of bearing too much iron, have oxidised and crumbled away. Such stone, if used in a building, would prove worthless and therefore dangerous. It is often the case, as I have observed during a long experience in civil engineering, that public bridges erected by counties are rendered unsafe by having their piers and abutments constructed of this kind of stone, and that, too, in places where most excellent material lay near at hand, and which a little knowledge of the nature of stone would have pointed out to the superintendent. Too frequently it happens that appearances of the most untrustworthy kind are relied upon where an ignorant person is set to do work which ought to be in charge of a skilled and well-informed engineer.

In judging of the probable durability of limestone, before subjecting it to any test of science, the same observations should be made as in the case of sandstone, with a view to ascertaining its weathering qualities. Any unequal discolouration of the face of the exposed ledge should be scrutinised carefully. Usually these are caused by the presence of iron in the composition of the rock. But limestones are much more injuriously affected by hidden faults of composition than any sandstones, and for this reason they demand a much more careful examination before any extensive quarries are opened. It is often the case that iron in limestone will do no more than discolour the outer surface on exposure to the action of air and rain-water, but even this is a serious defect when the stone is to be used in any structure wherein beauty is a chief object. For the rough masonry of ordinary bridges and for the hidden foundations of buildings, a cheap and durable stone is what is most wanted, and in these discolouration is not a fatal fault.

KETTON STONE.

Apropos of an article on "Edith Weston Stone" which appeared in our last week's issue, in which we referred to the "famed Ketton Quarries" as being "about worked out," we have received a letter from the agent of the proprietress of those quarries, to the effect that they are not worked out, and we therefore hasten to mention this in order to remove the erroneous impression which may have been created by the remark.

TRADE NOTE.

The Conservative Club, Rawtenstall, is being warmed and ventilated by means of Shorland's patent Manchester stoves and patent Manchester grates.

The Great Northern Railway has recently had an artesian tube-well bored at Werrington, near Peterborough, with the result that a splendid overflow rising to the height of 20 feet above the surface has been obtained This boring, which has been carried out by Messrs. Le Grand & Sutcliff, hydraulic engineers, London, reaches to the depth of 132 feet, and the water coming from the Lincolnshire limestone overflows at no less that 300,000 gallons per diem, which copious yield may have a material bearing upon the locomotive supplies of the district.

VARIETIES.

New Wesleyan Sunday schools erected in the rear of the Wesleyan Centenary Chapel at Boston (Yorkshire) were opened on Monday. The new premises have been built at a cost of about 2,400*l.*

The Borough Road was yesterday *en fête* in celebration of the opening of the new extensions which have been added to the justly popular Borough Polytechnic Institute. The additions, which have cost somewhere about 15,000*l.*, comprise four fully-equipped workshops for wheelwrights, boot and shoe makers, printers and bookbinders. A fine business-like looking gymnasium and some classrooms will also be found to add materially to the value and efficiency of the institution.

A new chapel for St. Bede's College, Alexandra Park, Manchester, which has been in course of erection for the past eighteen months, was opened yesterday. The chapel has been built at an outlay of 2,500*l.* The sermon was preached by Monsignor Moyes, formerly a member of the college staff. On Saturday Abbot Geudens will pontificate at Mass, and the preacher will be the Rector of Stonyhurst College (Father Brown). The music to be sung at Mass on each of these occasions has been specially written by Mr. H. G. Allen. A magnificent marble altar and reredos, the gifts of anonymous donors, form the leading features of the new chapel.

A monster blast was successfully carried out on Wednesday at Messrs. Farren's sett quarries, Rival Mountains, Carnarvonshire. A level had been driven into the rock, then cross levels at right angles, terminating in spacious chambers. Here over six tons of powerful blasting powder had been placed. The levels were then closed up with huge stones and Portland cement. An electric current of 400 volts was used to explode the charges. The upheaval was a magnificent sight, nearly 100,000 tons of granite being displaced. The arrangements were superintended by Mr. George Farren.

The new West Monmouthshire school which has recently been opened at Pontypool is a handsome and commanding building, occupying a site on the brow of an eminence overlooking the town and park. The frontages are in red brick, relieved by string-courses of Bath stone. In the south-east corner, set back into the east elevation, is a tower. There is another on the left, both being octagonal in style and 87 feet high. The main entrance is approached on either side by flights of stone steps, and in front of the door are two Bath

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating

Full particulars, Catalogues, Detail Sketches, Estimates re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

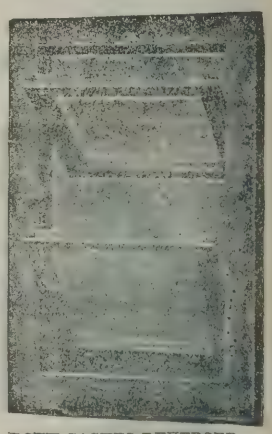
In the notice of Mr. Thornton's catalogue, which appeared in our last week's issue, we inadvertently gave the name as A. E. Thornton instead of A. G. Thornton.

DUFFY'S PATENT SYSTEM OF DOWELLED WOOD PAVEMENT.

An admirable specimen of workmanship and material may now be seen in the paving of the roadway which lies between the new Marylebone Station of the Great Central Railway and the huge caravanserai which is rising in the Marylebone Road. In this paving Duffy's patent system of dowelled wood blocks is employed, and the result is certainly one on which that gentleman deserves congratulation.

The method employed by Mr. Duffy in securing the blocks together consists essentially in the forming of recesses or holes in the blocks into which are inserted dowells or bonding keys of a special type. One of the leading features of this system is that all the blocks being fastened together mutually support each other, and the weight of the traffic is distributed over a considerable area instead of on each individual block. The effect of this improvement is that in many cases it will be practicable to dispense with the concrete foundation, which need only be used in streets subject to exceptionally heavy traffic; this distribution of the load is also an important factor in preserving the blocks from destruction by the concussion and stresses to which they are subject. Briefly, it may be safely stated that a roadway laid with hardwood under this system, and with close joints run in with mastic, presents all the advantages which could be desired under the heads of hygiene, economy and ability to stand the heaviest wear and tear, besides affording a sure foothold for horses. The same principle has been used during the past few years by Mr. Duffy for the laying of floors in public buildings, banks, insurance offices, churches, colleges, schools, barracks and other Government buildings, and it is claimed that in every case it has proved a success. As far back as 1895 Mr. Duffy's system was adopted by Sir J. Wolfe Barry, K.C.B., for the roadways of the Tower Bridge, where it may still be seen in a perfect state of preservation, in spite of the heavy traffic to which it has been subject. Trial pieces have also been laid in one or two other streets in London, where they have stood the test excellently.

GRAND THEATRE, LUTON.



The new theatre which is to be opened in Luton on Monday next is designed on the latest modern principles and affords a perfect view of the stage from every part of the house. It is a two-tier house constructed on the cantilever system, and there are only two columns upon the pit level and upper-circle level to in any way obstruct the view. The whole of the floors are of concrete. There is seating accommodation for about 1,000 persons, and standing accommodation for about 350 persons in addition. The proscenium opening is 24 feet by 24 feet, and the stage has a total depth of 30 feet and an extreme width of 46 feet, with an additional area of 5 feet by 15 feet on the prompt side. The proscenium opening is fitted with a fire-resisting curtain, and the stage with all latest improvements. Provision has been made for ten dressing-rooms and a band-room, with all necessary conveniences. Three refreshment bars have been provided, together with all necessary cloak-room and lavatory accommodation. Upon the pit level there are no less than thirteen entrances and exits, including two to the dressing-rooms in case of fire, so that the house could be emptied in a very short space of time, and ample provision has been made for exit staircases. Hydrants have been provided in all necessary positions in the event of an outbreak of fire, as well as sprinklers above the stage. The theatre is lighted by gas, there being no electric system of lighting at the present time in Luton. The main entrance will be paved with marble mosaic. The exterior is faced with grey Luton bricks relieved with quoins and dressings of red bricks and St. Aldhelm box ground stone for cornice strings, bands, &c., the ornamental gable being carried out entirely in stone, and the exterior has a pleasing effect. The whole of the work has been designed and carried out under the superintendence of Mr. Charles Herbert Shoppee, of 22 John Street, Bedford Row, London, while the contractor is Mr. W. G. Dunham.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

The opening meeting of the session of the Civil and Mechanical Engineers' Society was held at the Hotel Victoria, Northumberland Avenue, S.W., on Thursday, the 1st inst. Mr. Baines Dadley, the president, delivered an opening address. He pro-

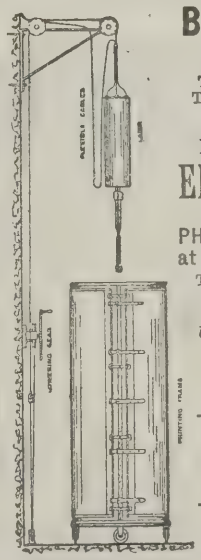
ceeded to refer to the various railway extensions in progress in London, especially the underground tubular system originally introduced by the late Mr. Greathead, which he described as a great step forward in the science of practical engineering. From the citizen's point of view he, however, considered it was not an altogether unmixed blessing, for travelling in tunnels was distasteful to most people, and should a serious accident occur in one of these, the extrication of the injured passengers might be extremely difficult. He was of opinion that if a fair trial was given to electric railways on the overhead system, it would be welcomed by the public. Dealing with the bridges over the Thames, he suggested that when a railway company was granted permission to construct a bridge over the river, it should be on condition that a road bridge was combined with it; such a regulation, he understood, already existed in some of our colonies. The steamboat traffic on the river had greatly fallen off because the land services had improved to an extent which had not been imitated by the river service, but with covered landing stages, improved boats running at greater speed, at more frequent intervals, there was no reason why an all-year-round service should not be resuscitated. The river was also badly lighted, and the public lost after dusk the advantage of this splendid highway through the centre of the Metropolis. Were the bridges and banks lighted with diffusive electric arc lamps, traffic could be carried on by night as well as by day. Referring to the labour question, he stated that during last year only the working men of this country through labour disputes lost 10,300,000 working days. He thought the root cause of the trouble was the destitute condition of the workmen in their old age, the example of which spurred the younger men to demand higher wages while they were able to work, and as this could only be obtained by combination against the employers, strikes were the result. He suggested that the Government should take over the funds and liabilities of the trade societies, and inaugurate a *pro rata* system of State pensions for which compulsory contributions of a percentage of the wages should be deducted by the employer and paid over to the State Department, and that a judicial commission should be appointed to act as arbitrator in all labour disputes, its decision being final and binding on both parties for a term of years. He knew the financial objections to such a scheme were considerable, but the savings from the present Poor Law administration would also be very great, and as the contributions might be extended over forty-five years and a very large minority would not attain the pensionable age, he opined the scheme in time would be self-supporting. The meeting closed with a vote of thanks.

ELECTRICITY AND THE SEASONING OF TIMBER.



AN important and novel process for the rapid seasoning of timber by the aid of electricity has been in operation on a large scale in France. By means of it the market price of timber can be much reduced and the quality improved. We are not surprised to learn that the 100-franc shares of the company that was started in France (with a capital of 1,200,000 francs) to work the process stand to-day at 475 francs.

There is not much difficulty in understanding the reasons for the remarkable success of the process. It is well known that old wood, on account of its resistance to damp, to variations of temperature, as well as its possession of qualities required for some special manufactures—elasticity, adhesiveness, impermeability, sonorousness, &c.—is the only kind adapted for the manufacture of string instruments, wind instruments, pianos, art materials, sculpture, furniture, joiner's work, carpentry work, cabinet making, the toy trade, cartwright's work, coach building, the stock of railways, oak flooring, the construction of boats and ships, the manufacture of casks, the mounting of fire-arms, &c., and is in continuous demand. To render timber fit for use the following losses have had to be sustained:—1st, sinking of capital during seasoning (from five to twenty years); 2nd, the rent of ground or warehouse; 3rd, expenses of insurance; 4th, loss arising from cracks and rot, which amounts to as much as 20 per cent., sometimes even 35 per cent., of the total volume of the wood. To this must be added the permanent danger of fire.

There is an interest, therefore, of the first order in finding an economical and rapid process for ageing the wood while securing to it the same qualities as the natural senescence. For fifty years the greatest sacrifices have been made towards this end.

During 1896 two Frenchmen made together the discovery so long attempted in vain and by so many diverse means. They finally arrived at a practical and definite solution of the problem. The trials bore at first on the preparation of the reed for clarionet reeds, and were made in great number by one of the discoverers, a musical instrument maker. The other gentleman interested then conceived the idea of applying the same treatment to all wood substances, and under the superintendence

of eminent specialists they have made real and absolutely conclusive industrial experiments. One difficulty to conquer was the permeation of thick joists. This was overcome in a most practical manner by a very rapid electrical process. The electro-capillary permeation which resulted therefrom was soon susceptible of applications as numerous as they were unforeseen.

The timber to be treated is put into a quadrangular tank of liquid, immersed to rather more than half its depth, and an electric current is applied through a metallic conductor, so arranged as to distribute it throughout the area. In the space of four minutes the sap commences to exude visibly at the lower part of the end of the wood, forming a line of viscid froth. In the space of six hours the sap is seen, by the ceasing of exudation, to be entirely extracted. The wood is then taken out and placed in another tank, from which a septic solution is forced from below into the pores denuded of sap by an electro-capillary method ; duration, three hours.

After the two electrical processes have been completed the wood undergoes a drying process by being placed for two or three or more weeks in covered sheds, provided with a continuous through current of fresh air. If of large scantling or obstinate nature, a longer period is allowed, it being placed for three or more days in hot, dry rooms. The processes are then all complete, after lasting about a month.

Among the advantages of the new process are the following :—One month's interest on capital, instead of years ; power of utilising cheap or damaged woods, hitherto almost useless, and of applying them to new purposes ; facility of dyeing woods to prescribed colours throughout their entire thickness, thus rendering painting unnecessary ; gain in treating green woods without loss of time—the greener the wood the quicker the action of the process ; complete freedom from shrinkage, twisting and warping ; immunity from damage by insects or animalculæ ; great reduction in inflammability ; increased strength and better surface ; resistance to damp or moisture ; extraordinary increase in the resonance and fine tone of musical instruments ; economy of application ; enormous diminution in the destruction of forests so far as arising from premature rot in the timber actually sold, and practicability of rendering wood fireproof, if required, at a very small additional cost by one further process.

We are informed that a beginning in England is about to be made with important works at Charlton for supplying the requirements of British timber merchants and manufacturers, and gentlemen interested in timber will shortly be afforded an opportunity of witnessing a practical demonstration of the process. Those who desire to be invited should at once send their names to the Secretary, Electrical Timber Seasoning Company, 159 Victoria Street, London, S.W.

THE NEW CENTRAL UNDERGROUND STATION.

After many delays the chief station on the Glasgow Central Railway is approaching completion. It is so far finished that it will be handed over to the company on December 15, and shortly afterwards the present temporary premises will be vacated. The termination of this long piece of laborious work will be welcomed, says the *Glasgow Herald*, not only by travellers but by the general public. The station has a frontage to Argyll Street of 154 feet, and to Hope Street of 123 feet. It is one storey in height, and the chief feature of the exterior is a circular dome at the corner where the two streets converge. This embellishment is somewhat squat in appearance ; but it is perhaps rather soon to pass an opinion upon it, having regard to the fact that the original plan, which has not yet been carried out, provided for the erection, to the north of the station area, of a high building, in relation to which the station as viewed from the street would form a sort of terrace. The plans were prepared by Messrs. John Burnet & Son, Glasgow, and the design may be described as a free treatment of the Classic style of architecture. The fronts are divided with pilasters extending to the parapet, surmounted by massive stone vases decorated with grotesque masks. The dome is enriched with four life-sized statues carved in stone, emblematic of industry, commerce and transport by land and sea. The building rests on a base of polished red granite, upwards of 6 feet in height, the superstructure being of stone. From the pavement to the top of the parapet the height is 26 feet, and to the lantern of the dome 46 feet. At the eastern end of the Argyll Street façade access is had to the parcels office, and at the extreme end of the Hope Street front there is a semicircular recess with two granite pillared entrances, the one to the offices yet to be constructed in the high building and the other to a suite of rooms to be used for arbitrations in connection with the business of the company. Internally the station may be said to have three floors, the first being on the street level,

ELECTRIC LIGHT WIRING.

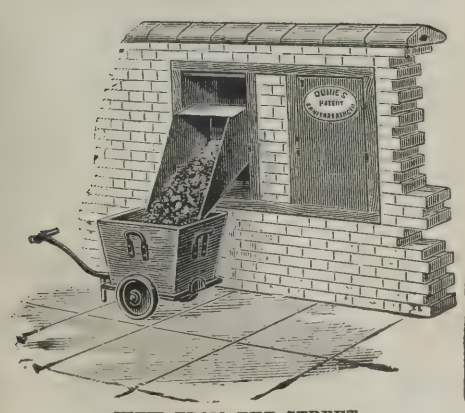
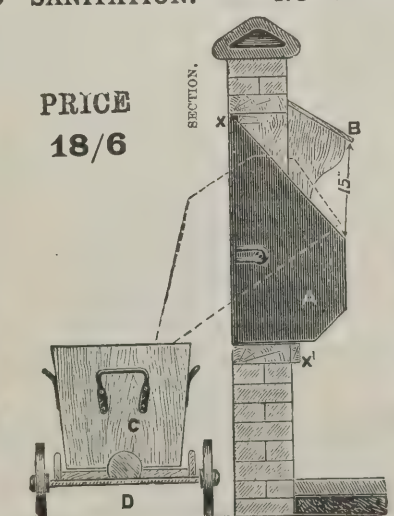
where the booking offices are situated, the next below that being occupied by a distribution hall, and the third by the train platform. Entering from the Argyll Street or Hope Street doorways, which are protected with overhanging verandahs supported on iron cantilevers, passengers will find themselves in front of a range of booking windows. Descending by a stairway 10 feet wide they will enter the passenger distribution hall, a handsome glass-roofed apartment surrounded with arched bays and having a restaurant 60 feet long at one side as well as a ladies' room 27 feet long and other necessary accommodation. From the distribution-hall two gangways, each 19 feet wide, lead down to the platform, while provision is made for the traffic to and from the high-level station by means of a ramp or inclined plane 12 feet wide. For the convenience of the public who require to pass from the one station to the other without going out to the street a booking-office is provided at the low-level platform. The most part of the floors and fittings are of teakwood, and a cheerful effect is imparted to the interior by the free use of lightly-tinted glazed tiles, which are variegated by bands of tiles of darker shades. The arbitration chambers include a large room with sliding screens, which may be removed as required, thereby making a hall 60 feet long by 24 feet in width. There are also rooms for counsel, witnesses, clerks and others.

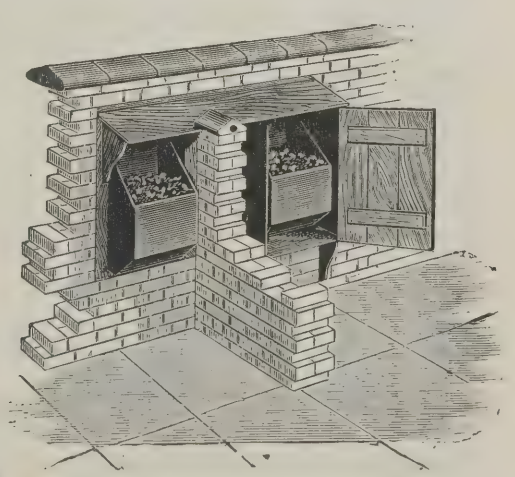
SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, December 5, Mr. W. Worby Beaumont, president, in the chair, a paper was read by Mr. George Thudichum, F.C.S., entitled "The Bacterial Treatment of Sewage."





The author observed in his opening remarks that he did not enter into any theoretical considerations, taking it as a fact that the majority of those concerned accepted the general doctrine of bacterial treatment. The paper dealt with practical applications only. After describing the special uses of different processes under varying local conditions of fall, nature of soil and sewage, the author gave in detail the method adopted at Worcester Park, where the Cheam and Cuddington sewage is received, to convert a process of precipitation and irrigation into one of bacteria bed treatment and irrigation when desired, showing how the necessary beds were constructed by excavation, and filled with burnt ballast produced on the farm, at a total cost of about 325*l.*, the quantity of sewage to be dealt with amounting to 80,000 gallons daily in dry weather. The conversion of the Sutton sewage works was also alluded to, the cost there having been something less than 2,000*l.* for a daily flow of half a million gallons of sewage, whilst the saving in working expenses was 500*l.* per annum. The author then discussed the general questions of the interception of road detritus; the catching by screens or otherwise of pieces of rag and any large floating matter; and the dealing with night sewage by the provision of a special bed for its reception, with syphons for the automatic emptying of the bed in case of storms.



The author next dealt with the problem of sewage treatment as applied to hospitals, schools, country houses and other small communities.

For dealing with the sewage from a small community one of two biological methods may be employed, according to the fall available. In the first method, which may be either on the lines of the Sutton or of the septic system, or a combination of the two, the sewage is passed continuously through the tank or for twenty-four hours on to a coarse bed, and then on to fine beds, where it remains for two hours and is then discharged. If bacteria beds only are employed, they should be four in number, viz. two coarse and two fine grain, each being of sufficient capacity to take a whole day's flow. The sewage, or the overflow from the cesspit where such exists, is allowed to pass into one of the coarse beds for twenty-four hours, and is then diverted to the second bed, the effluent from the first being discharged into the corresponding fine bed. Here it is allowed to remain during two hours, and is then finally removed. By this method there is no doubt far more anaerobic action in the coarse bed than is the case when the system is worked normally; but the rest, which is given every alternate day, gives an opportunity for the destruction by oxidation of the organic matters retained by the bed. The attendance required is very slight, and can be readily given by a gardener; it consists merely in turning a few valves, with an interval of three hours between the first and second operations, and in an occasional raking of the surface. If the fall be sufficient to admit of the employment of two sets of beds, the septic tank and the fine beds only can be employed; and in this case the alternating gear used with the latter is essential, as otherwise the attendance would prove a severe tax.

In the second method it is presupposed that the sewage cannot be delivered at or sufficiently near the surface to be

passed on to a bed. In this case the best plan is to provide a storage tank, a coarse-grain and a fine-grain bacteria bed, each of the three being capable of containing the sewage of an entire day of twenty-four hours. At a fixed time on each day the sewage should be pumped from the storage tank into the coarse bed, should remain there two hours and then be passed into the fine bed, and after a similar period of rest in the latter be finally discharged.

The sewage from the Claybury Asylum of the London County Council has been treated by a single pair of coarse-grain bacteria beds with perfect success for over three years. At Radley College an installation has recently been completed, in which the overflow from a cesspit is treated by two pairs of beds, viz. two coarse and two fine grain. These beds are constructed by excavating, the sides being of brickwork and the bottoms of clay puddle. The coarse beds are 16 feet by 10 feet by 3 feet deep each, and the fine 16 feet by 12 feet by 3 feet deep each. The bed material is coke, that in the coarse beds being all rejected by a screen having a half-inch mesh, and that in the fine having all passed a mesh of three-eighths of an inch, with the fine dust removed. The water capacity of each bed is 160 cubic feet, that being the maximum quantity of sewage which they have to deal with daily.

It is a source of much gratification to the author that further experience has caused no alteration of the views expressed by him in the paper read before the Society two years ago regarding general principles and methods of working. Much additional knowledge has been gained and the applications of the bacterial method have been shown to be of wider scope than was at that time generally recognised; but the facts then related still form the basis on which such knowledge is founded, and the theories set forth have been only amplified and verified without suffering any integral change. The method of working the beds by alternately filling and emptying, allowing them to stand full for a limited time and empty for as long a period as possible, has been proved over and over again to be the correct one. Where the method of constant flow through a filter is employed, the results have so far not been shown to be satisfactory. In many instances, as for example at Wimbledon, the effluent escapes from the burnt ballast filter, surface-choked, and—being cut off from air by its covering of earth—in a semi-putrid and stinking condition. This fact was noticed by many members of the Society of Municipal and County Engineers on the occasion of their visit to the farm. Whatever be the first treatment, the final purification must be aerobic; and so far as the author has yet seen, this is best accomplished on the lines laid down as a result of the Barking experiments between 1892 and 1896.

HOUSING THE POOR IN LONDON.

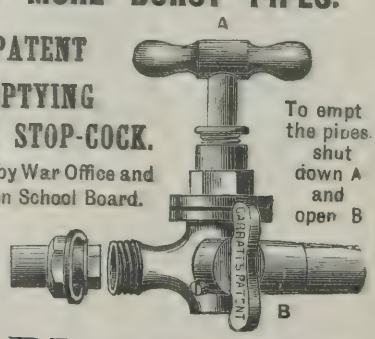
According to Lord Onslow the building regulations made by the London County Council to govern the designing of their dwellings have made it impossible to house the poorer of the working classes, and in fact their tenants are well-to-do men—many of them in the service of the State—while only 20 out of 6,929 of those actually displaced are now living in the Council's dwellings.

The housing committee allege that this is owing to the high standard of accommodation required by the Government Departments, whereas in fact all that the Home Office (which is the supervising authority under Part I. of the Act) has done has been to endorse the somewhat luxurious conditions laid down by the Council itself. In 1889, shortly after it came into existence, the Council laid down regulations of which the principal were as follows:—

(*a*) Staircases not to be central, to be at least 4 feet in width, and to be finished with a dado of glazed or hard-pressed bricks.

(*b*) Regulations governing construction of basements.

(*c*) Bath and wash-house accommodation to be provided in every block of buildings. Closets to have doors and windows opening directly to the open air.



(*d*) Sizes of rooms to equal 144 feet for living-rooms and 96 feet for bedrooms.

(*e*) Height of rooms to be 9 feet.

Every building to be, if practicable, distant from any obstructing building one and a half times the height of the obstructing building.

But the cost of these was found to be prohibitive, and in 1893 it was resolved to increase the height of the buildings from four storeys to five, and to reduce the height of the rooms from 9 feet to 8 feet 6 inches. Towards the end of 1894 the conditions reached their least exacting point; under these Sonning and Culham buildings were built, and are the cheapest the Council has erected, for they are there able to let thirty two-roomed tenements at the (for the Council) very low rent of 5*s.* 6*d.* each. In 1896 an increase of the sizes of the rooms took place, but in 1897 there was a slight reaction, when the Home Office inquired why the Council should not be maintain-

ing its former standard, but upon being assured that the Council's experience showed that the most suitable size for a living-room was 160 feet superficial, and for a bedroom 110 feet superficial, the Home Office at once accepted the reduced superficial area. This has been the standard adopted by the Council and sanctioned by the Home Office ever since. Now in the Boundary Street area the average rent per room per week is 2*l.* 10*s.* 4*d.* (*sic*), while in the adjoining district of Hornsey the District Council's rents average only 1*s.* 8*d.* per habitable room. The architect in his report to the Council observes upon these buildings :—"The cottages are attractive, not only from this low rent, but from their general appearance, convenience of arrangement and their gardens. But however cheap they may be, and however suitable they may be considered by some persons, they are obviously not buildings which the Council can copy unless a most material change is made in its policy and in the views of the Government with regard to the size of rooms in the Metropolis."

What reason can be given why the Council should not make a material change in its policy, and what is the justification for throwing the blame on the Home Office, when the Council has never proposed regulations to it with a view of housing those whom they displace at rents which they can afford to pay? No man can at present become a tenant of the Council who does not earn 30*s.* a week or upwards. The buildings of the Industrial Dwellings Company at Deptford contain sitting-rooms of about 90 feet superficial, and bedrooms averaging about 100 feet superficial; each tenement has a water-closet, and some have small sculleries in addition. Taking two and three-room tenements as examples, the superficial area of the two rooms would be about 290 feet superficial. The rents are for the two rooms 4*s.*, while the three-room tenements vary from 5*s.* 3*d.* to 6*s.*, according to the floor on which the tenement is, and if it has a scullery.

The Guinness Trust buildings in Snow's Fields, Bermondsey, contain living rooms of about 140 feet superficial and bedrooms about 100 feet superficial, with a scullery common to four or five tenements, and a water-closet common to two or three tenements. Again, taking two and three-room tenements as examples, the superficial area of a two-room tenement will be about 240 feet and of a three-room tenement about 340 feet. The rents for the two-room tenements vary from 4*s.* 9*d.* to 5*s.* 6*d.* and for the three-room tenements from 5*s.* 3*d.* to 6*s.* 3*d.*, according to the floor on which the tenement is.

It is, no doubt, very pleasant to have a luxurious dwelling if one can afford it, but a dwelling of some kind every man must have, and it is the Council's duty to try and provide those whom they displace with a tenement which they can afford to occupy.

Until the Council has applied to the Home Office and been refused permission to construct such buildings as have been erected by Hornsey and by the two companies referred to, they are neglecting a course whereby they might remove the stigma hitherto attaching to them owing to the failure of their operations. Let them at the same time, with the energy that they throw into their schemes for reform of taxation, seek powers from Parliament to sell cleared areas for commercial purposes and invest the proceeds in the erection of dwellings elsewhere, and they may yet achieve more even than the much despised Metropolitan Board of Works accomplished, and that without calling upon the ratepayers to grant an aid in relief of rent to the favoured tenants of the Council.

WIDENING OF PARLIAMENT STREET.

THE improvements committee of the London County Council have prepared a report dealing with the application of Her Majesty's Office of Works for a contribution from the Council towards the cost of the widening of Parliament Street. It appears that the Council was asked to join in a conference at the Office of Works to determine the nature and extent of the contributions to be made by the Council and the Westminster Vestry. To this request the improvements committee acceded, and deputed the chairman (Mr. Shaw-Lefevre) and the vice-chairman to wait upon the First Commissioner, having previously ascertained, however, that the vestry had resolved to take no part in the conference, as they had not decided to make any contribution towards the cost of the improvement. At the conference it was stated, on behalf of the Office of Works, that it was proposed to widen Parliament Street by setting back the line of frontage of the public buildings to be erected there, so as to give a width of at least 135 feet, instead of about 60 feet as at present. At the same time, it was proposed to do away with King Street, and to utilise its site in connection with the new public offices. The difference between the area of the land to be added to Parliament Street and that to be appropriated for buildings in King Street would amount to 17,858 square feet. It was contended that this widening of Parliament Street would be a great public improvement, relieving altogether the congestion

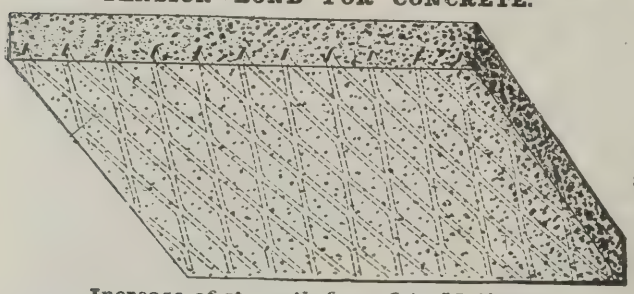
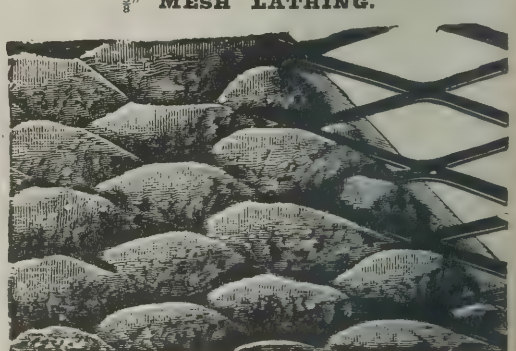
Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

of traffic there, and adding greatly to the dignity of the approach to the Houses of Parliament and Westminster Abbey. It was suggested, therefore, that the London County Council might properly contribute out of the county fund to this improvement, and that the proper measure of such contribution would be the value of the land thus added to Parliament Street, after accounting for that appropriated in King Street. If the value of this land to be given up were put at 10*l.* per square foot the amount would be 178,580*l.*, but the First Commissioner freely admitted that as the Office of Works would not lose the frontage value of the lands, inasmuch as they would retain the frontage to the widened thoroughfare, the value should more properly be estimated at 6*l.* per square foot. This would make the value of the land given up to the public way about 107,000*l.*, to which should be added the cost of the paving works of the widened street. It was further pointed out that it was proposed to double the width of Charles Street, which would also be a public improvement. Incidentally it was mentioned by the First Commissioner that the clearance of the block of buildings bounded by Parliament Street, Charles Street, King Street and Great George Street had cost the Office of Works the sum of 405,000*l.*, which included 100,000*l.* the value of the land forming part of the Westminster Bridge estate, owned by the Office of Works.





After stating what has in the past been done in connection with the widening of Parliament Street, the committee mention that the clause authorising the Council and the Westminster Vestry to contribute was not originally in the Public Offices (Westminster) Site Act, 1896, but was inserted during the progress of the Bill through Parliament without the Council or the vestry being consulted in the matter. Neither was the Council asked for a contribution until arrangements had been made for the acquisition of the land. These and other facts were stated by Mr. Shaw-Lefevre at the conference, and he suggested that the inference to be drawn from them was that the improvement about to be effected by the Government would not entail any cost when the commercial value of the land was taken into account. While admitting the very great public importance of the improvement in the widening of Parliament Street, he felt doubtful whether the Council would be justified in making a contribution towards the acquisition of the land for the widening of the street, though he expressed the opinion that the cost of making up the roads would be a matter for consideration.

Since the conference the improvements committee have very carefully considered the whole subject and now report:—"It appears to us that the Council would not be justified unless it were clearly shown that it was being carried out at a loss. As the Office of Works in 1882 so strongly represented to the Metropolitan Board of Works that in their opinion a scheme exactly similar to that now being undertaken by them could be carried out without loss, and as a body of private promoters were in 1896 also prepared to carry out this same scheme at their own cost, and under the belief that they would make a profit thereby, it cannot be shown that the Government is incurring a loss by the transaction. Moreover, it must not be forgotten that the Office of Works are retaining for the purpose of the public offices the very valuable frontages to the widened thoroughfare of Parliament Street. We consider, therefore, that the Council should not be asked to make a contribution towards the cost of the acquisition of the land needed for the scheme. We fully recognise the value of the scheme about to be carried out by the Government in the widening of Parliament Street and the improvement of the approaches to the Houses of Parliament and Westminster Abbey. We think that the Council, as the central authority in London for carrying out large street improvements, may well desire to show its appreciation of the value of this work to the extent of taking upon itself the cost of making the widened roads in Parliament Street and Charles Street. We think that a reasonable estimate for the two thoroughfares would be 12,000*l.*, and we consider that the Council would do well to offer to contribute that amount." The committee accordingly submit a recommendation to that effect.

IDEAL LONDON.

At Toynbee Hall, on Saturday evening, a lecture was delivered by Mr. Frederic Harrison on the subject of "Ideal London." He said that he had been asked to give a lecture on "Ideal London" as a conclusion to the series of lectures on London, past and present, which had been delivered at Toynbee Hall during the season; and by "Ideal London" he meant "London as it might be, as it should be and as it shall be." The true ideal was no idle dream, but the justification of study and the motive of all useful endeavour. London was his birthplace, and for nearly sixty years had been his home. For two generations he had watched its growth and rebuilding; and as a member of the County Council he had experience of the practical difficulties of making improvements. In suggesting the

ideal London, he should try to keep within the bounds of practical statesmanship; but he was not bound by limits of time or by the exigencies of existing prejudices and legislation. An ideal London should contain all that pertained to pure and perfect citizenship. Now modern civilisation had failed to carry on some of the best elements of city life as known to the ancient and Mediæval worlds. London did not inspire in Englishmen the feelings which Athens, Rome, Florence and Venice excited in their citizens. It was now valued as a market, an exchange, an office or a playground, though that had not always been the case. But a city that covered 120 square miles of buildings was not a city, but a wilderness of houses, and city life was impossible for a population of four or five millions. People must be within walking distance of the country, or the town became a prison and not a city. Therefore ideal London would not exceed two millions of inhabitants—and it would be better with only one million—and it would be but a third of its present size. He was no lover of the tenement or flat system, but it was absolutely necessary if a great city were not to grow to unmanageable bulk. London at present had no ideal tenements, and few satisfactory ones; but when spacious, airy, clean and lofty blocks, provided with common libraries, baths, playrooms and sickrooms were available, the economy of such wise co-operation would leave room for boulevards, parks, gardens and playgrounds. He repudiated the idea that London would go on increasing at its present rate; for he was sure that the causes which had led to that increase were only temporary. In ideal London the Thames would run as clear as at Henley, and again it would be the great highway of traffic. The bridges would be doubled in number, and the disfiguring railway bridges would have to be suitably treated. Steam-engines would probably be prohibited within the City, and the air would cease to be polluted by the poisonous fumes of millions of chimneys. It was really strange how long we had allowed preventable nuisances to choke us. A pure and unlimited water supply would be carried through great aqueducts, as in Rome, from inexhaustible lakes and reservoirs. This would have been done long ago for London but for commercial self-interest, political intrigue and administrative jealousy. Water, no more than fresh air, would be bought from money-making speculators. It was a prime necessity of life, and as such it was the duty of the State to supply it pure and in abundance. Science and organisation would annually save many thousands of lives now sacrificed by preventable diseases. Already the death-rate of London had been reduced by one-half in the present century, and there was no reason why it should not be reduced very much further. With regard to the question of burial-grounds, he believed that London would return to the ancient and honoured practice of cremation. This practice would obviate the danger of infection to the living and the difficulty of visiting cemeteries which could only be reached by a long and fatiguing journey. It was too much forgotten that cremation was only the scientific process of preparing the remains of the dead for disposal. The problem of the reorganisation of London had taken a new phase since London had been broken up into so many Parliamentary boroughs. He did not advocate "tenification," but he looked forward to the different districts of London, while united under a strong central Government, having each a separate civic life of its own, available for all citizens within a mile of their homes and within reach of their own influence. The buildings of London, which had now neither permanence nor self-respect, would be changed in character, and be made more worthy of the genius which built Westminster Hall and the Abbey. But through all reconstruction he hoped that the historic associations and landmarks of a city which had an unbroken record of a thousand years would be preserved even at the expense of some regularity. New lines of traffic would be created, and the heavy traffic would be diverted to the deep electric railways. With easy and open avenues of communication, London might become as bright and gay, as full of fountains and flowers and statues as Paris and Florence.

At the conclusion of the lecture Mr. Harrison invited questions from the audience, and being asked how he thought the population of London could be brought within the smaller limits which he had contemplated, he replied that the efficient cause would be economic. He did not suggest any legislative restrictions, but he could not believe that London would always continue to occupy its present unique position as the centre of the financial and commercial world.

BUILDING IN GLASGOW.

A PAPER was read on the 2nd inst. by Mr. Robert James Bennett at the Glasgow Building Trades' Exchange on "The Relationship which the Exchange ought to have to the Technical College." The lecturer said that on the one hand they had workmen limiting the apprentices for fear of there being too many workers in the trade, and on the other they had boys

who, under the present system of education, thought they knew everything, and considered it beneath their dignity to go through the groundwork of any trade. Why was it in the boasted second city of the empire they had been the last to provide sound technical schools worthy of the name? He blamed the merchant princes, the Chamber of Commerce, the Merchants' House, the Trades' House, the City Fathers and themselves. The main objects of the Glasgow and West of Scotland Technical College were to afford a suitable education to those who wished to qualify themselves for an industrial profession or trade. It had been twelve years in existence, and be said emphatically that it had not accomplished anything like the high ideal of its founders. In respect to technical education the German Emperor had taught the whole world a lesson. There were technical colleges at Berlin, Munich, Dresden, Leipzig, Cologne, Karlsruhe, Hanover, Heidelberg, Düsseldorf and Hamburg, and the Government had just issued an order converting all the general technical schools into colleges in towns of from 60,000 to 100,000 inhabitants, the cost falling upon the municipalities, in the first instance, aided by State grants of from 1,500*l.* to 3,000*l.* a year according to requirements and the number of pupils. In Glasgow, as he had said, the whole community was to blame. They ought at once to set their house in order by building a technical college worthy of the name, and instead of there being accommodation for only 4,000 students, it ought to be sufficient for 10,000. For the building trades there ought to be a duly qualified set of practical teachers and a visiting committee sent from the Trade Exchange, not merely visitors of inspection in name, but skilled and qualified workmen willing to visit the school at least once a week, so that the students would not require to unlearn many of the theories which they had been taught. It would never do to be contented with their present position. As to the Building Trades' Exchange, he had to confess that it had not made that progress in four years which he had hoped to see. They had failed to bring the architects and the surveyors as a body to learn the true value of the Exchange. They ought to be in a position to speak to them as customers of the members of the Exchange with some degree of authority begotten of knowledge, just as the architects and surveyors spoke to their clients with the drawings of their building, or an artist with his picture, or as a writer with his books. He was strongly of opinion that the extension and improvement of technical schools was a matter in which the Building Exchange should interest itself. They had an education committee, which he understood was not overburdened with work, and he suggested that the members should put themselves in touch with the managers of the Technical College and obtain if possible some share for the Building Exchange in the scheme of management. This, he had no doubt, would readily be accorded to so influential a body. At the close Mr. Bennett received a cordial vote of thanks.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

24491. Arthur J. Keeble and George H. Innes, for "An improved method of making Cambridge Portland cement from chalk and marl."

24603. William Frederick Mason and William Henry Wilson, for "Improvements in kilns for bricks, pottery and the like."

24629. Albert Edgar Alexander, for "An improvedprocess for producing artificial asphalte."

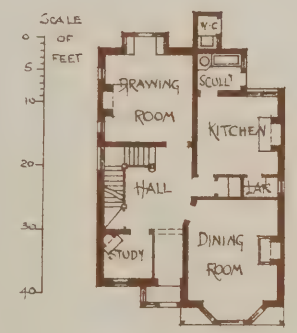
24659. Herbert Briggs, for "Improvements in apparatus for moulding cups and like articles of clay or other plastic material."

24763. Charles David Phillips and James Pring, for "Improvements in roller mills suitable for grinding mortar, clay and the like."

24928. George Austin, for "Improvements in brick-making machines."

24941. Oliver Howl, for "Improvements in apparatus for drying bricks or other plastic articles."

Specification Published.



27561. Johnson & Walker, for "Kilns for burning cements, limes and other like substances."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The Architect.

THE WEEK.

The appointment of Sir William Anderson as Director-General of Ordnance Factories caused much grumbling among one class of military experts, who objected to him as a civilian. It was not generally known that Sir William was probably the most versatile of mechanical engineers, and one who has had the widest experience. The ignorance may be accounted for when it is known that for the greater part of his life he was accustomed to play the "ghost." His wonderful inventive powers and practical skill were familiar to engineers with whom he had contracts, to men of science and to many foreign rulers. His death on Sunday morning, in his sixty-third year, is a national loss. By birth he could be claimed as a Russian, and he possessed what is called the freedom of St. Petersburg. But in his boyhood he came to London and studied at King's College. Then he was apprenticed to Fairbairn, where he was engaged on constructional ironwork as well as on machinery. The earnestness of the man in those days is suggested when it is said he walked the hospitals for a time in order that he might be qualified to treat accidents among his employés, and he could discourse on the mechanics of the human frame in a manner which surprised eminent surgeons. His apprenticeship over, William Anderson accepted a partnership with a Dublin firm, and his entry was immediately followed by most important contracts. He constructed bridges, devised improvements in signals, adopted ingenious arrangements for supporting buildings, and produced many kinds of machinery. Without his aid there was hardly an important work completed in Ireland in which metal was employed. He was always in the best of good-humour in dealing with troublesome customers, and used to liken himself (for he had a boy's delight in novels) to Mark Tapley, who was also a "Co." In Dublin he met with an extraordinary accident. Machinery in a distillery was being overhauled by his firm, and as one part was exceedingly dangerous he had it carefully cased. The workmen found it necessary to remove the casing, but forgot to replace it. Anderson went to the building after the men had left, and as he was passing by a wheel his arm was caught and the whole of the muscles were torn from the shoulder to the wrist. He fainted, and as there was nobody present he lay unconscious for a long time. While still in a state of unconsciousness he got up and was passing across the yard when a gate porter perceived his condition. He was brought to his own house and the ablest surgeons sent for. They decided to amputate the arm at once, but on the appeal of a young doctor who was one of Anderson's friends, the operation was postponed for some hours. Eventually the arm was saved. He was busy at the time preparing working drawings for an exhibition building, and he rigged up an apparatus with several pulleys which supported the maimed arm while using the right arm on his drawing-board in bed. The incident shows his character and success in overcoming obstacles and performing his work regardless of the cost to himself. After eight or nine years in Dublin he joined the well-known firm of Easton & Amos (now Easton, Anderson & Goolden), where there was more scope for his ability than in Ireland. He erected the great works at Erith, and it would be hard to say what was not produced in them by the firm. Among his important contracts were several for the Egyptian Government under Sir John Fowler, whom he has followed so quickly. Both in the Institution of Civil Engineers and in the Institution of Mechanical Engineers William Anderson's genius was recognised, and he stood among the foremost representatives of practical science. It was a sacrifice for a man of his rank to accept a post in a Government factory, but he was anxious to serve his country regardless of his personal loss. During his term of office he had to encounter much opposition, and we are afraid his conflicts hastened his end. Sir William Anderson was a great man and a good man, and his loss will be felt in other countries as well as in England.

The Trustees of the Marylebone Club can command without payment of fees the advice of several eminent lawyers. There was therefore no need to go before the Chancery Division in order to discover that a greenhouse was a "building." Many tenants of cheap villas and confined gardens in the metropolitan area who have set up little structures of glass and wood without the consent of the County Council could enlighten the Trustees on that point. A new tennis and racquet court is being erected at "Lord's." The back wall is about 30 feet high, and the party wall of a garden belonging to a Mr. Clifford was utilised as a part of it. As a consequence there was interference with his light and air. The defendants, however, said that only the north light was obstructed, and that there was ample light on the east, west and south sides. Mr. Justice Kekewich, who heard the case, said that when a building was of such a character that excessive light was important to it, then it was a building in the sense of the words of the Prescription Act. The same rule applied to it as to studios for painting or photographing. His lordship said there was no doubt that there was an obstruction of light, but the question was whether it was of material character. He considered that architects and surveyors were far too apt to ignore the value of diffused light. There were many houses, especially in London, which were dependent entirely upon diffused light, and if the sky area was obscured and the diffused light cut off the light was as much diminished as if the pencils of the sun's rays were cut off. A new staring red brick wall of such a height was undoubtedly injurious, although no complaint was made on that account. Mr. Justice Kekewich, in conclusion, held that the plaintiff was entitled to a mandatory injunction to restrain the interference with the access of light to the greenhouse. The injunction would be suspended for three weeks to enable the defendants to appeal if they desired to do so. If they gave notice of appeal within the three weeks then the injunction would be extended until the appeal was disposed of. There is nobody who would like to see "Lord's" suffer in any way, but we suppose the trustees have become so accustomed to umpires, they are in a difficulty in any case where those arbitrators are not visible.

A new use has been found for the Röntgen rays in what may be called palimpsestic application. There is, as our readers know, a dispute about the genuineness of the Droeshout portrait of Shakespeare, which has been often engraved. In Stratford-on-Avon it is believed to be the most authentic of all. It has been proposed to apply a solvent to a small portion of the surface in order to test whether there is not another portrait beneath. But Mr. Edgar Flower, the chairman of the Governors of the Shakespeare Memorial, says he has already consulted a picture restorer on the subject, and was informed that the experiment would have to be performed on the face, which would be fatal to the picture. Mr. W. E. Wilson, F.R.S., says he has ascertained by testing an old portrait of Sir Philip Sidney, which is also painted on a wood panel, that by means of the X rays and a fluorescent screen any work which is underneath can be seen without removing the paint. By that method many knotty points about pictures can be cleared up, and the test is worth a trial on the Droeshout portrait.

Custom will apparently exercise an important influence in decisions under the Workmen's Compensation Act. At the Brompton County Court on Friday last a labourer claimed 227*l.* 10*s.* from Messrs. Kilby & Gayford, builders, for injuries sustained through the negligence of their foreman. The plaintiff was only nine days with the defendants, and was attending a bricklayer at a building in Earl's Court. The first time he carried up his hod, through habit he put out his hand as if several more rounds of the ladder were still to be ascended. Not finding one, he tumbled to the ground and was severely injured. Evidence was given that a ladder should be at least 6 feet above a landing in order to be safe, whilst at Earl's Court it was 3 feet. It was remarkable that an hour before the accident notice was given to the plaintiff to leave, because the foreman considered he was not sober. A verdict for the full amount claimed was given.

T. HAYTER LEWIS.

ALTHOUGH it would be difficult to name any building by the late Thomas Hayter Lewis which is an adornment to London, yet his life was in many ways useful to his contemporaries. There are architects who will remember him as a Professor in University College, some have had the benefit of his advice in litigious cases, and many know him as the author of papers which were read before various societies. He was always respected as an honourable man, and his death on Saturday removes one of the Nestors of the profession, who was well acquainted with the various changes which have occurred during the past sixty years. Born eighty years ago, he was introduced to architecture in the office of Joseph Parkinson in Sackville Street. Subsequently he obtained more acquaintance with building, valuing, and especially financial operations in the office of William Tite. When he left him he travelled for a time on the Continent, and on his return entered into partnership with Mr. Finden.

The first important commission of the firm was for "The Royal Panopticon Institution," which stood on the site of the Alhambra in Leicester Square. The whole management of the business was left by Mr. Finden to his partner. At the time there was a general educational movement, and it was supposed that any institution which appeared to extend the purposes of the Exhibition in Hyde Park must be a success. The Panopticon Company was, therefore, incorporated in February 1851. The institution was to rival the Polytechnic, and to combine instruction with amusement. The managing director thought only of attracting crowds, and with that end proposed the adoption of a Saracenic style. Hayter Lewis said he was unable to recall any Panopticon institutions which the Saracens had erected, and was not satisfied. But on reflection he came to the conclusion it was not more incongruous to set up a building in Eastern style than a Greek building which would be seventeen centuries older. Why should not he follow the example of the leaders of the profession and retain his commission? He therefore set to work with the utmost despatch, for very little time was allowed for study. The building was to contain a large central hall, two lecture-rooms, laboratories, workshops, engine-rooms, gas works, &c. The hall was 98 feet in clear diameter, with recesses for boxes. The dome was 72 feet across, with a circular light of 32 feet diameter. The hall was to have been square on plan, but the fear of obstructing ancient lights compelled a change. The dome presented some difficulty in construction, for neither buttresses nor ties were possible. The fourteen main ribs were therefore constructed on the ground in such a way that each was able to stand in equilibrium without extraneous aid. It was afterwards not difficult to unite them, and large water cisterns were used to steady the ribs. The decoration was mainly carried out in primary colours, with a liberal employment of gold leaf. It was found by experiments of the Professor of Natural Philosophy that when ordinary positive colours are used, one-half a surface to be seen by daylight, and two-thirds if seen by gaslight, can be gilded without any gaudiness.

The building exemplified the results of a great many experiments, and was in keeping with its purpose. But the public that gravitate towards Leicester Square are not enthusiasts for science, and the Panopticon was hardly more successful as a speculation than James Wyld's Great Globe. So many new products were introduced in its construction, it might be called a building museum, and it was well suited to be a place where novelties could be shown.

If in the years that succeeded Hayter Lewis could not keep his name before architects by works as novel as the Panopticon, yet he was at least able to demonstrate by papers that he was a careful student of the art. He always seemed to have particular problems which he endeavoured to solve by travel rather than by the study of books. Hayter Lewis was, therefore, apparently an eligible successor to T. L. Donaldson, when the latter, in full vigour of body and mind, resolved in 1865 to give up teaching in a classroom. It was remarkable in his opening lecture as Professor of Architecture at University College to find the man who was afraid to touch Saracenic forms a few years before had become an admirer of the style, which was, he said, "so light, so elegant, so redolent of the grace and luxuriance of the East, and yet so bold, that no artist could seek a better subject for his pencil, no poet a more graceful rendering of his dream." Hayter Lewis thus proved that we cannot really understand any true work of art until we endeavour to imitate it. Then we realise that what is usually called study is only becoming acquainted with superficial qualities. Saracenic architecture had appeared to him peculiarly interesting, not only from its charm, but through the inseparability of decoration from construction. He held that "architecture without sculpture and painting is like a strong-limbed tree throwing around its sinewy arms without the delicately sculptured foliage to give it grace, or the beautifully coloured flower and leaf to give it life." In 1865 there were only a few who thought of evolution as a key to history in all its aspects. Hayter Lewis was not among the initiated, or he did not believe the law of progress was applicable to the arts. He told the students how he believed, with the Greeks, that art sprang "in its full strength, all armed as Minerva, direct from the god, as little a creation of man's as language is." There was, he said, no clear authentic record of an advance in art and civilisation from the lowest point to the highest. He held that "when a nation's art or industry has suffered change, it has come not from the unassisted mind of the nation itself, but from some altogether different influence of another race, conquering or civilising, as the case might be, and bringing with them their own peculiar style of art to mix with or supersede the other." Thirty years have produced much evidence about the history of the arts which does not support the theory of Hayter Lewis, but what he said was enough to prove the new Professor was a thinker.

The architectural history which had most fascination for him was that of France. It was almost a compendium of ancient styles. As he said, "It is the mixture of Roman, Norman, Rhenish and Eastern which makes the study of French architecture so interestingly difficult." But the interest was enhanced, doubtless, because Hayter Lewis acquired the happy knack of accommodating himself to the peculiarities of the people. "I have travelled," he said, "as much as most men, in most European countries, but in none have I found as an utter stranger a more kindly welcome than in France." His papers, if collected, would form a volume that would be of much use to architectural students who go on French tours.

Hayter Lewis was careful to discriminate between the variety of influences which were in operation in France. The Romans themselves, he remarked, like their architecture, never died out; the Easterns sent not only examples of their art but artists also. Along the Rhine and the Rhone came northern arts, and in the north-western region the Normans were working at their own style as if they were isolated from the rest of France. But while admitting that when the Pointed style in France had thrown its glamour over the architects there was an earlier development than in England, Hayter Lewis considered there was more delicacy, refinement and beauty of detail in the foliage and mouldings of English buildings, and as evidence pointed to Lincoln and Westminster and the chapter-houses of Salisbury and York.

Ten years ago appeared "The Holy Places of Jerusalem," by Hayter Lewis. It has lately acquired additional interest, for many of the photographs which are reproduced in the pages were taken by Lieutenant Kitchener, R.E., the present Sirdar, who has just had several weeks' experience of the inconvenience of hero-worship. In this book a theory of Mr. Fergusson is challenged, perhaps we ought to say overthrown, but in archæological contests there is always a possibility of renewal after defeat. Fergusson perceived that the Mosque of Omar and the Mosque el-Aksah at Jerusalem were without the niche or mihrab which serves to indicate the direction of Mecca, and is a necessary feature in all Mohammedan temples. He therefore came to the conclusion that they were Christian edifices. On subsequent study of the subject he went further, and asserted "that the building so well known among Christians as the Mosque of Omar is the identical Church of the Holy Sepulchre erected by Constantine." He acknowledged that the theory was never broached by any preceding traveller or speculator.

Interesting as is the question whether the mosques were raised by Christian or Mohammedan builders, there is another of still more importance. Was the ground formerly occupied by the Temple of Jerusalem? Unfortunately the ancient writers who gave descriptions of buildings were unable to realise that a plan, however simple, would be of more value to posterity than any verbal substitute for it. JOSEPHUS appears to be precise in his measurements, but as there is no certainty about what is meant by "from valley to valley," the starting and terminal points of his lines must be always problematic. That doubt should exist about the position of so remarkable a building as the Temple is so extraordinary as to become mysterious. The tradition of the Jews in Jerusalem is that the Dome of the Rock marks the site. In the twelfth century that belief was adopted by BENJAMIN OF TUDELA, and in the fourteenth century by Sir JOHN MANDEVILLE, or whoever wrote his travels.

HAYTER LEWIS has investigated the puzzle with a patience that is creditable. He concedes that the Dome of the Rock has not the characteristics of a mosque, and that it was simply an oratory built over the rock or Sakhra "long regarded with reverence as the threshing-floor of ARAUNAH, the Jebusite, by whose side the avenging angel stayed the plague, and which the Mohammedans believe to be the stepping-stone whence their great Prophet started on his night ascent to converse with the Deity." But there is no reason to connect the name of OMAR with the building which is the shrine for the treasure-stone. HAYTER LEWIS, after a close examination of the building, came to the conclusion that the details "were not all executed at the same time, nor as forming part of one general design, but that they were reconstructions of older buildings of various dates which had been partially destroyed, and whose materials had been put together in after times, with others worked at the time of the reconstruction by some skilful architect." According to HAYTER LEWIS, while on plan the Dome of the Rock resembles Italian buildings of the time of CONSTANTINE, the capitals and columns are from their debased character likely to belong to a subsequent time. It was the opinion of Professor SEPP that the building was entirely erected by JUSTINIAN. It appears there is no documentary evidence to support that theory, and the details do not correspond with those in the emperor's buildings.

There is an inscription round the colonnade which records that the building was erected in A.D. 691, by ABDALLAH, the Imám al Mamán. The name is a substitution of a later time for ABD-EL-MELIK, to whom, in an Arab work which was written in the tenth century, the work is ascribed. There are also other references to the builder. On the evidence of those authorities, and after a careful examination of the building, HAYTER LEWIS came to the conclusion that "the Dome of the Rock was the work of the Arabs, designed for them by a Byzantine or Persian architect, and with Persian or Byzantine workmen, before the Arabs had developed any definite style of art of their own, and that it was built with the capitals, bases and columns ready to hand, being derived from the remains of churches and other buildings destroyed by CHOSROES and other invaders."

In his book, HAYTER LEWIS also investigates the origin of other structures and natural features in Jerusalem which are of universal interest, such as the Mosque Aksah, the Golden Gate, the Holy Sepulchre, Jeremiah's Grotto and Siloam. Throughout he proves himself to be an archæologist of the analytical school. It is not by a comprehensive glance at a large and intricate building, or by the effect of a first impression, that we are likely to arrive at valid conclusions about the time and conditions of its construction. There is no place in the world where it is so difficult to separate realities from appearances, history from poetic legends, and there is satisfaction in knowing that the English architect came to the inquiry with an intellect that had been developed and sharpened by similar inquiries, and with a reverence for Christianity which no over-zeal on the part of the representatives in the Holy Places could diminish.

Among other archæological writings by Mr. HAYTER LEWIS were notes to a translation of PROCOPIUS'S work on "Justinian's Buildings," and an appendix on Byzantine sculpture to NAVILLE'S "Aanas el Medineh." He edited some of the publications of the Palestine Pilgrims' Text Society. Mr. LEWIS was also the author of the parts of the article in the ninth edition of the "Encyclopædia Britannica" which relate to Classic and modern architecture. As a writer he could claim to have produced important work, and it all represented anxious labour. Illness prevented HAYTER LEWIS from taking a prominent part in his profession after 1869, but he retained his professorship at University College until 1881, when he was succeeded by Professor ROGER SMITH, who has upheld the reputation of his predecessors for skill and knowledge.

ARTISTS AND ARTISANS.

THERE are obsolete words in living languages, and some languages are described as dead, but taken as a whole words may be said to endure longer than men. Men, however, differ from their ancestors, and many words also undergo changes as time runs on. It is, therefore, often difficult to ascertain whether they are used in their original significations. Doubts are, perhaps, more common in the employment of technical terms. There are, for instance, treatises on casting which are not two centuries old, and apparently are fully descriptive of the processes employed for producing the numerous bronze statues of the age of LOUIS XIV. But modern founders are afraid to employ them owing to the difficulty of interpreting the meaning of some of the words and phrases. It is found to be safer and more economical to follow processes which are familiar than to run the risk of making experiments of which the results cannot be foreseen. Scholars can interpret words as seems best to them, and if they err they incur at the most the abuse of rivals. But an erroneous interpretation in a workshop is followed by a more heavy punishment. It was doubtless owing to the inability to translate terms correctly, and consequently to the employment of the wrong drugs, that the prescriptions of the Greek physicians fell into disrepute. Modern invalids may in consequence suffer, for as Professor PERCY GARDNER says, "If we greatly surpass the Greeks in our experience of unhealthy conditions of life, their knowledge of health was surely wide and sound." It is to be doubted, however, whether many admirers of the Greeks would submit themselves to the experiments which would determine whether the remedies of HIPPOCRATES and GALEN surpass those employed in modern practice.

It must be remembered that as all men in our time are not very precise in their choice of words their predecessors were no less lax. Even official terms are often inexpressive or only partially expressive of the meaning which custom assigns to a word. The word surveyor is an instance. The old signification, a man who measures land, is no longer conveyed by it, for land-surveying as a special business has but few followers. It now represents a man who measures other things; or in the case of official surveyors measuring may be only a small part of his duties. In some cases measuring is no part of the employment. Hereafter the word may be a puzzle to students who will endeavour to understand the nineteenth century, just as now we find that in SHAKESPEARE'S time various meanings were attached to surveying, the practice of architecture being one of them.

As for the word architect, it would need a volume to deal with it. HORACE WALPOLE was very proud to have discovered a document, dated 1209, in which there was mention of one ELYÆ who was described as "ingeniatori," and who received 10 marks on account of some repairs to the king's house, Westminster; while in another document of 1210 WILLELMUS PUINTELLUS received the large sum of 1,216*l.* 13*s.* 6*d.* on account of operations at the Tower. According to WALPOLE, "WILLIAM PUINTELL might be only a surveyor, but ELYAS was certainly an architect." Apparently he judged from the difference in the amount of money. In WALPOLE'S time architects received only a small sum if compared with what was given to the builder or to a steward having charge of building works, therefore ELYAS, with his 10 marks, although called an engineer, was the architect, and PUINTELL the surveyor of the time. But in that age there was probably no general contractor, and the payments were made through PUINTELL, who would have as much right to be called architect as surveyor.

WALPOLE was finical, and was not pleased to encounter a verbal difficulty. Accordingly he ridiculed "the absurdity of those times in couching orders in a language which they could not write and addressed to persons by whom it was not understood." But a scholar of a later age has no right to assert that in a past age the meaning of a word was not understood. At the present time it would be hard to define in one phrase the manifold duties of a surveyor. But there is not a ratepayer in England who is unaware of the extent of a surveyor's authority, and is prepared to remonstrate if there is the slightest excess. There is the difference between language as spoken and language entombed in dictionaries. In the thirteenth century we may therefore be sure the duties of an architect were well understood by clients, although he might be described under a variety of names. One was no doubt master-mason, but there is no reason to suppose that a man so described spent the greater part of his time in cutting stones or in fixing them. In France it is believed that the word architect was not employed until the sixteenth century. The first who bore the title was SÉBASTIEN SERLIO. It is not stated, however, that he introduced a revolution in the organisation of building works, and apparently he simply continued the practice of the master-masons and masters-of-works of an earlier time. SERLIO was described in one of the king's orders as "nostre peintre et architecteur ordinaire," but it is remarkable that about the same time ESTIENNE, in his Latin dictionary, defines *architectus* as "maistre masson ou charpentier." The fact was the old architects had to be versatile. No one was surprised to have them described as carpenter, painter or sculptor, and on that account it was taken as a matter of course that PHILIBERT DE LORME should be designated by the king as "nostre architecte ordinaire" as well as "nostre amé et féal conseiller et ausmonier ordinaire." An architect was compelled to be everything by turns, and by his skill and experience to be able to deal with all emergencies.

While the architect was a "man so various" it did not follow that every mason and carpenter was an artist, and much less an architect. In looking over old records the reader is impressed with the difference between the artist and the workman, although very often the two words appear to be used as if they were synonymous. In ESTIENNE'S dictionary he does not give artisan or artist as the equivalent of the Latin word "artifex," but "ouvrier." It is possible that the monopolising of the word "arts" by the old universities had much to do with what may now appear to be a degradation of the term that could be used to express the fine arts. Thus it has been said that a university should be formally based and emphatically live in the faculty of arts, because the arts existed before other faculties, and the masters of arts were the ruling and directing body. That is the belief of high authorities in our time, but it was not questioned throughout the Mediæval and Renaissance periods. It is easy to believe that to speak of a man as an artist would be to suggest that he was a scholar—a bookman rather than a creator who used stone, wood or the precious metals. To speak of a man as an artificer, artisan or a fabricator up to the end of the sixteenth century did not mean that he followed a mechanical employment, for the terms might be applied to RAPHAEL or MICHEL ANGELO.

Words cannot be used indefinitely with impunity. The confounding of artists and artificers not only was an obstacle to the progress of art, but brought about many changes. Incredible as it may appear, the origin of the Académie des Beaux-Arts was one of the consequences of the indifference to precision in language by the French. We cannot, however, dwell at any length on the circumstances. As we have said, the Mediæval artists, although they could not be considered as a class apart, appear to have had recognised positions. In the guilds or confraternities they occupied posts of authority, and were known as sworn masters. But as still happens among the freemen of some English corporations, the sons of masters, although not always possessing ability, claimed their fathers' privileges. For a time the arrangement was allowed. But abuses followed. Incompetent men claimed to be artists, and mechanics on account of being members of a guild considered they were entitled to all the benefits which the statutes conferred. The public suffered, and from time to time in France it was necessary to invoke the intervention of the kings. There is a remarkable edict of HENRI III. in which he condemns the ignorance and idleness of young artists who appear to think that daubing is painting and the carving of grimacing figures is sculpture. But how was a reform to be introduced when some of the worst specimens of the unskilled fellows contrived to flourish under the title of peintres-valets to the royal court? The Flemings and Italians utilised the occasion and visited France, where they succeeded in obtaining many orders which should have gone to Frenchmen. At all times disunion promotes foreign competition in France. But as prior to the formulation of the Code the laws were in an indefinite state, numerous actions were taken against the foreign artists for invasion of the corporate rights of the native sculptors and painters, and in the end there was an imbroglio which was harassing to all but the lawyers.

Some clear-headed men in the seventeenth century realised that a coup was necessary to overcome the disorder. As is usual in such cases, logic was brought to their aid. It was concluded that as the origin of the evil arose from the confounding of two different classes of men, there could be no remedy until the original separation of the artist and the artisan was restored. In the atelier of SIMON VOUET students were carefully trained, and they realised that it would become their mission to overthrow the system which was fostered in the guilds of painters and sculptors. One of the results was the formation of a new Academy of Saint Luke in Paris, where artists whose ability could be proved were alone received. The old guilds of painters and sculptors were condemned at the same time, and by the authority of the Crown. The guilds then appealed to the French Parliament that was sympathetic towards ancient rights and succeeded. Academy and guilds were allowed to co-exist, and a competition began between them. That was continued during several years, and as a result a royal academy was founded of which the Académie des Beaux-Arts is the representative.

We have something to learn from the French experience. The attempt which is being made to promote "arts and crafts" is not free from the danger which for a time wrecked progress in art. Incompetent workmen are now assuming the airs of artists, and productions which no manufacturer could expect to sell are presented to the public as if they were inspired by genius and as dexterously executed as if they came from Japan. The public are not always good judges, and are rather partial to eccentricities if they appear under an attractive name. There are no tests imposed on the new race of creators, and they have the advantage of finding eulogists who have an interest in the promotion of extravagances. The public should be able to take care of themselves, but the true artist, and the architect more especially, cannot feel assured when he knows his position will be assailed by enemies who profess to have a common interest with him, but who degrade art instead of defending it.

BUILDING BY-LAWS AND THEIR ADMINISTRATION.

A JOINT meeting of the Royal Institute of British Architects and the Birmingham Architectural Association was held on the 9th inst. at the rooms of the Royal Society of Artists, Birmingham. In the absence of the president of the Institute (Mr. Aitchison) through illness, Mr. W. M. Fawcett, one of the vice-presidents, took the chair. The subject for discussion was "Building By-laws and their Administration."

Mr. C. E. Bateman explained that the subject had been selected by the local association because the Birmingham City Council was about to frame new building by-laws, and had promised to submit the draft to the Association. They hoped to have the assistance of the Royal Institute in considering these by-laws, and also in an effort to obtain greater uniformity in the by-laws of Birmingham and the surrounding districts, from the want of which a great deal of difficulty and annoyance arose.

A paper on the subject by Mr. W. Henman was read by the Secretary of the Institute. Mr. Henman explained that the paper was intended to indicate the widespread feeling that building by-laws and their administration throughout the

country are in a most unsatisfactory condition. The writer was afraid that unless the members of his profession could bring united pressure to bear upon the responsible authorities the evils under which they had so long suffered might extend, and cause in the future still greater annoyance and irritation to architects as well as injury and loss to the public. He excluded the Metropolis from consideration because the Building Act applying thereto had recently been revised, and because it was administered by an experienced body of men who, he believed, were generally architects who had had architectural training, while there was power of appeal to the London County Council. In the provinces an entirely different state of affairs existed. Some latitude in a few special particulars to meet local requirements might be necessary and advisable, but when every district authority was allowed to make all sorts of petty variations confusion resulted, and architects were often caused the greatest annoyance and inconvenience by having plans disapproved in one district which would be passed without question in another. This frequently resulted from the interpretation different surveyors might put upon the same by-law or regulation. Some local authorities made regulations simply by resolution of the Board, which they did not even print or circulate or submit to the Local Government Board. Architects as a body had not the slightest desire to evade or obstruct any by-law, or even any regulation, lawfully made with the object of securing safety and health, provided such by-law or regulation was uniformly and reasonably enforced. The so-called model by-laws of the Local Government Board were confused in their arrangement, and went too much into detail on matters of minor importance or matters in which knowledge was as yet imperfect, and omitted reference to matters of structural importance, the neglect of which in some buildings might be a definite source of danger. Moreover, they were wrapped up in a vast amount of unnecessary legal jargon and excessive verbiage. The district by-laws were often set forth in a most confusing manner, especially where local Acts affected the reading of the by-laws, and the difficulties were increased by the uncertain methods of administration. Apart from the larger cities, provincial district surveyors were usually selected from a class of men trained to road-surveying and sewer-laying, and with little knowledge of building construction and less of architectural propriety. They appeared to have imbibed the idea that architects were their natural enemies, and devised means for wasting their time and causing them trouble, quite regardless whether by so doing the safety or health of any individual might be secured. In populous districts the surveyors were assisted by building inspectors with, as a rule, less knowledge and discretion. Dwellings for the working classes were still erected in the most flimsy fashion by the jerry-builder, who generally went scot free, while architects who desired to build scientifically and well were continually harassed by unreasonable restrictions and requirements. Too many members of district councils were interested directly or indirectly in building operations, and the surveyor could serve them in many ways and in turn obtained their support. Inspectors were but mortal and were generally underpaid ; it was therefore not surprising that some of them came under the influence of the speculative builder, and little credit accrued to them by drawing attention to his irregularities, but éclat was gained when an architect was reported as having contravened even the letter of a by-law or avoided resistance to unreasonable demands simply for the sake of peace and quietness. Year by year authorities were grasping at greater powers of control, and by means of local Acts of Parliament, by-laws regulating the rights of property were trenched upon or the cost of building was seriously and unnecessarily enhanced. In order to counteract these evils members of the architectural profession must act together and strive to obtain the co-operation of building proprietors by letting it be known, through the public press, that action was being taken, in the hope of regulating local authorities, and then official, within reasonable limits. Pressure must also be brought to bear upon the Local Government Board so that building by-laws might be in all essentials uniform, and only such regulations might be sanctioned as were proved to be necessary to secure health and safety. In addition, courts of appeal easily accessible should be constituted. The paper also drew attention to the employment of district surveyors in carrying out buildings of architectural character, such as infectious hospitals, baths, libraries, markets and even town halls and council houses. Rarely had they received suitable training for such work, and by their doing it the architects were deprived of legitimate employment. When a building was required a surveyor often suggested that an architect's fees might be saved by employing the salaried servant. The surveyor then obtained the services of some architectural hack who prepared the design. When the work was done the surveyor suggested that he should receive extra remuneration, which generally took the form of a rise in his salary, and often the temporary hack became a permanent addition to the staff, so that the ratepayers, instead of simply having to pay an architect the usual 5 per cent. on the cost of the work, were saddled with an annual cost which, in the aggregate, largely exceeded the legitimate fees for carrying out the work. In addition to that it was a well-known fact the actual outlay on buildings carried out under the control of surveyors was generally far in excess of what it would be in the hands of a qualified architect. In some districts surveyors were permitted to undertake private work. They prepared designs in the public offices with the assistance of their staff. Necessarily these designs were passed without question, and the writer of the paper had even heard of difficulties being thrown in the way of building proprietors and architects evidently for the purpose of diverting work into the hands of the surveyor. These were crying evils which it was to be hoped the Institute would exert itself to remedy.

Mr. W. Woodward said that the difficulties Mr. Henman spoke of with regard to building by-laws and their interpretation applied equally to London. They had, however, a tribunal of appeal consisting of two architects and one solicitor or barrister.

Mr. T. Naden said that in Birmingham their appeal was to a committee of the Council. He had experienced no difficulty with surveyors. They had only to stroke the surveyor the right way to get what they wanted, and the committee need only be appealed to when the surveyor considered that the by-laws were not sufficiently elastic to meet a special case, and could not take the responsibility upon himself.

Mr. Nicoll said that in his personal experience the surveyors were not so very bad to deal with. The architect, if he went about in the right way, generally got his own way in the end.

Mr. W. Milburn said that in Sunderland they had a set of unsuitable by-laws, framed by the Corporation, and the architects got up an agitation, in which they obtained the assistance not only of the builders but of the leaders of the workmen's societies. The result was that they got the by-laws amended.

Mr. J. Cotton condemned some of the by-laws enforced in country towns as tending to destroy the picturesque irregularity which was one of the charms of such places. He suggested that the local association should call into consultation the architects from the surrounding districts. The late Birmingham surveyor was one of the best men they could have had in such an office, and he had found no difficulty in the present surveyor's rulings when the matter was put to him in the right way. By-laws should vary to suit local conditions—as, for instance, those of stone districts—but in what was really one large town uniformity was desirable. For instance, they could do things in Handsworth which they were not allowed to do in Moseley.

Mr. P. Gordon Smith said that Birmingham having special powers under the Consolidation Act, the suburban districts could not exactly copy its by-laws. He thought, however, that it would be a very great advantage if all the local authorities in the neighbourhood would meet in Birmingham and form a committee to go into the whole subject, with the view of framing a code of by-laws. They might, perhaps, get the assistance of some one from the Local Government Board to point out to them what they could or could not do. He was sure that the representations of such a conference would receive the utmost consideration from the Local Government Board. As to the "regulations" of which complaint had been made, a district council could make what regulations it liked, but it could not enforce them. There was no penalty. As for the model by-laws the Local Government Board could not compel the adoption of any one of them. These by-laws had stood the test of the courts very well, but if their phraseology were obscure there was no objection to the local authority printing explanations or illustrations with them. As for the surveyors, he had found them excellent officers and very amenable to reason. In many of the large towns the surveyors were simply splendid men.

The Chairman said that it appeared to him that the Birmingham architects should take a leaf from the book of their Sunderland colleagues.

Mr. J. Smith said that in Sheffield work to the amount of a million and a quarter was being done from the surveyor's office.

A Member suggested that if they took this point up they would be open to the accusation of thinking about their personal interests rather than the public good.

Mr. A. E. Sawday thought they need not be thin-skinned on this question. It was taken up in Leicester, with the result that a resolution of the Council was passed that for all work over a certain amount an outside architect should be engaged.

On the motion of the Chairman the following resolution was unanimously adopted :—"That the Institute is in sympathy with the action being taken by the Birmingham Architectural Association as to the framing and administration of by-laws in Birmingham and the surrounding district, and will be very pleased to assist the local society by advice or suggestion in their action."

ROYAL ACADEMY SCHOOLS.

On last Saturday evening Sir E. Poynter, P.R.A., distributed the prizes to the successful students of the Royal Academy Schools. The ceremony took place in the lecture-hall, Burlington House, and was attended by a large number of Academicians and Associates, as well as by the students of the schools and some of their friends.

The President, before distributing the prizes, said that those present were aware that as that was an off year—a year when there was no gold medal—it was not customary to deliver an address. At the same time they must allow him to congratulate them on the all-round competition for the prizes. For the Creswick prize he noticed several excellent paintings. He was very glad to see a larger and a better competition in the drawings from the antique, which he thought was a very important part of the student's course of study. He then proceeded to present the prizes, which were awarded as follows:—

Landscape painting—A Bridge over a Trout Stream, Creswick prize (30*l.*), Fred Appleyard. Painting of a figure from the life (open to male students only), silver medal, first, George Murray ; second, Edward Francis Wells. Painting of a head from the life, silver medal, first, Mary Towgood ; second, Fred Appleyard. Painting of a draped figure (open to female students only), silver medal, first, Grace Elizabeth Page ; second, not awarded. Cartoon of a draped figure, Calliope, silver medal and prize (25*l.*), George Murray. Design in monochrome for a figure picture, Joseph presenting his Father before Pharaoh—Gen. xlvii. 7, Armitage prizes, first (30*l.*) and bronze medal, not awarded ; second (10*l.*), Frank Cadogan Cowper. Design for the decoration of a portion of a public building, Harvest, prize (40*l.*), George Murray. Set of six drawings of a figure from the life (open to male students only), first prize (50*l.*) and silver medal, George Murray ; second (25*l.*), Frank Shelley ; third (15*l.*), Christopher David Williams ; fourth (10*l.*), not awarded. Drawing of a head from the life, silver medal, first, William Dennis Eden ; second, Annie Margaret Page. Drawing of a statue or group, silver medal, first, Fred Appleyard ; second, Annie Margaret Page. Perspective drawing in outline (open to painters and sculptors only), The Summer House in Kensington Gardens near the Fountains, silver medal, no competition. Model of a design, Endymion, whilst asleep, is visited by Diana, first prize (30*l.*), Stanley Nicholson Babb ; second (10*l.*), Alfred Bertie Pegram.* Set of three models of a figure from the life (open to male students only), first prize (50*l.*) and silver medal, Gilbert William Bayes ; second (20*l.*), Alfred Bertie Pegram.* Model of a bust from the life (open to female students), silver medal, first, not awarded ; second, Winifred Florence Hunt. Model of a design containing figure and ornament, Youths gathering Grapes, silver medal, Stanley Nicholson Babb. Model of a statue or group, silver medal, first, Frank Arnold Wright ; second, Stanley Nicholson Babb. Design in architecture, A Town Church, travelling studentship (60*l.*), William Hawke. Set of architectural drawings, The Hall of the Middle Temple, silver medal, first, no competition ; second, no competition. Set of architectural designs (upper school), prize (25*l.*), John Stevens Lee. Set of drawings of an architectural design (lower school), prize (10*l.*), Alfred Edward Corbett. Plan of a building, A Town Club House, prize (10*l.*), Arthur Campbell Martin. Original composition in ornament, silver medal, no competition. Perspective drawing in outline (open to architects only), The Interior View of the Library at Lambeth Palace, silver medal, no competition. The Landseer scholarships, in painting, of 40*l.* a year, tenable for two years, have been awarded to Frank Shelley, Arthur G. Ackermann and Christopher D. Williams (extra). In sculpture, to Gilbert W. Bayes and Mortimer J. Brown (extra).

* Disqualified, owing to having received the same prize before.

WAVERLEY ABBEY.

The council of the Surrey Archæological Society have issued a statement showing the work that has been already done in regard to the excavations at Waverley Abbey. The first points of interest disclosed included the west end of the chapter-house with what remains of its beautiful doorway. It was then decided to continue the excavations, and Mr. William Anderson set about clearing the chapter-house and the slype or covered way adjoining to the original level. Since then the ground south of the cloister, and lying between the cellarium and monks' dormitory, has been explored, with the result that now may be seen the kitchen block, wholly uncovered ; the walls of the monks' refectory, with the stone bench running along three sides ; portions of the walls of the calefactory, or warming-room, and of some other rooms. The church, too, has been partially excavated, and, amongst other things, the divisions of the chapels in the transepts brought to light. East of the chapter-house and monks' dormitory, according to the normal Cistercian plan, should be the infirmary with its hall, chapel (said to have been larger than that at Trinity College, Oxford) and kitchen offices, the abbot's house, the prisons, &c. In the cloister, opposite the chapter-house door, the coffin was found of William Mauduit, the third baron of Hanslape, and king's chamberlain, whose burial took place in October 1194, as recorded in the annals of Waverley. North of this was one other interment, and to the south of it four more, that at the end having above it a plain stone slab without inscription. The importance of this discovery lies in the fact that the coffins were not of stone, as is usual in our abbeys, but of oak, almost as sound as on the day they were deposited here. Photographs and careful measurements having been taken, the earth was replaced. During the excavations many objects of interest have been brought to light, including window glass, some of it painted, with portions of the lead casements in which it was fixed; a large number of floor tiles, many having designs on them; besides a great store of fragments of Mediæval pottery, some of considerable interest, and of glass vessels and other objects illustrative of the domestic life of a monastery. The statement adds :—"In fact, the excavations have so far shown such good results that the Council has decided to continue the work next year if sufficient funds are forthcoming. When it is considered that Surrey possesses at Waverley what remains of the first abbey founded in England by the great Cistercian Order, and, further, the importance to archæology generally of having an accurate ground-plan of the ruins, members of the Society can hardly fail to approve the action of the council in inaugurating a systematic and thorough exploration of the site. The cost of the undertaking will be considerable, and beyond the means ordinarily at the disposal of the Society. It is confidently hoped, however, that a great deal of support will be forthcoming from outside the Society, especially from those residing in the diocese of Winchester, with which the abbey was so intimately connected. Meanwhile members are invited to assist the executive by contributing to the fund now being raised with a view to the resumption of work in the spring." Contributions should be addressed to the Rev. T. S. Cooper, Chiddingfold, Godalming.

THE MICRONESIAN VENICE.

On Monday evening at the meeting of the Royal Geographical Society a paper was read by F. W. Christian, in which he described his visit to the Eastern Caroline Islands and his explorations among the famous ruins of Nan-Matal. He said that the area occupied by the islets of Nan-Matal is about nine square miles. For the most part they are deserted, and altogether there are not above twenty people living on the three or four inhabited ones. Some of them are planted with cocoa-nuts and bread-fruit, and are visited occasionally by fishing parties. The king's island of Tomun and the shores of Metalanim harbour are fairly thickly populated, but the folk as a rule give Nan-Matal a pretty wide berth. They say the place is haunted, and on certain of the islets, such as Pan-Katara and Pei-Kap, nothing will induce them to set foot. All the enormous quantity of basalt which the ancient builders used must have been brought in canoes or rafted down the coast, a distance of 20 to 30 miles. These pillars and blocks were carried down to the sea from the dales below the precipices of U and the great perpendicular scarp of Chokach, where the columnar basalt formation is very strikingly marked. Here were grand natural quarries, whence the builders might select all the shafts and pillars required, lying around ready shaped to their hand. The first of the islets visited from Uchentau was Nan-Tauach, the most remarkable of all the Metalanim ruins. The water-front is faced with a solid terrace of massive stonework about 6 feet wide, standing over 6 feet above the shallow waterway. Above is a striking example of immensely solid cyclopean masonry. A great wall, between 20 feet and 30 feet high and about 10 feet in thickness, formed of basaltic prisms laid alternately lengthwise and crosswise, encloses an oblong space, which can be entered only by the great gateway in the middle of the west face, and by a small portal in the north-west corner. The right side of the gateway is overshadowed and all but hidden from view by the dense leafage of a huge Ikoik tree. In olden times the walls must have been considerably greater in height, but much of the masonry has now fallen into lamentable ruin. A series of huge rude steps leads into a spacious courtyard, strewn with fragments of fallen pillars. This encircles a second terraced enclosure topped by a remarkable projecting frieze or cornice of stonework. The outer enclosures were 185 feet by 115 feet, the wall varying in height from 20 feet to nearly 40 feet, the inner, which forms a second conforming parallelogram, measuring 85 feet by 75 feet. Height of the wall 15 feet to 18 feet, average thickness 8 feet. Another rude flight of steps leads up to the great central vault or treasure-chamber, said to be the grave of an ancient monarch, who bore the dynastic title

of Chau-te-Leur. It was difficult to gain much information about the old traditions at first. The natives certainly know something about the history of these ruins, but do not care to talk of them to strangers. This reticence he had patiently to overcome little by little, and consequently bit by bit a tolerably explicit little chapter of history was built up. It appeared that in olden days Ponape was much more populous than at present. All the tribes in the days of the builders were united under a powerful line of kings. The last of this dynasty met his death facing a great invasion of barbarians from Pati-Air, the barren lands of the south, probably some portion of New Guinea, the New Hebrides, or some neighbouring portion of Melanesian area. They arrived in a great fleet of canoes under the command of a fierce and terrible warrior, Icho-Kalakal. The savage invaders poured in upon the peaceful settlers and blotted out the ancient civilisation, after a great battle, in which numbers were slain on both sides. Part of the walls were thrown down and the defenders were either slain in battle or offered up in solemn sacrifice to the war-gods of their conquerors. King Chau-te-Leur himself in his flight perished in the waters of the Chapalap river, at the head of Metalanim harbour. The Ani changed him into a blue river fish, which the folk of Metalanim to this day will not eat. The underground chamber or vault which bears King Chau-te-Leur's name lies right in the centre of the inner precinct, facing the great gateway. It is about 8 feet in depth, roofed in with six enormous slabs of basalt. The flooring was paved by some heavy basalt blocks, which they had great trouble in lifting away. Below this was a layer of soft vegetable mould, thickly matted with a tough root-growth that made excavation somewhat troublesome. The side nearest the entrance threatened soon to fall into ruins, and they had to pursue digging operations very cautiously in this corner for fear of being crushed by the collapsing of these mighty masses of masonry. There are three other tombs or vaults besides the large central one, situated on the south-west, east and north-west sides respectively. They are smaller in size, and gave up rather scanty results to their excavators. The one on the east side is very narrow and some 12 feet in depth. Paul, the king of the Metalanim tribe, sometimes used them as dungeons to confine those who offended him—a punishment greatly dreaded by the natives, in their childlike horror of the dark and of the viewless spirit forms with which their fancy peoples these lonesome places. "The eyes of the spirits are watching everything you do," said Keroun, one of the lecturer's workmen, as he tendered his resignation. "I know they are angry; they will not injure you because you are a white man, but they will punish us. I am very much afraid: I cannot sleep at night, and I would like to go home." Standing in the south-west angle, where the wall is nearly 40 feet in height, one looked down upon a green abyss of nodding woodland, with never a glimpse of the network of canals rippling below. The north-east angle is occupied by an enormous banyan tree, towering full 50 feet above the masonry in which it stands firm-rooted, thrusting its bunches of thread-like root fibre into every crevice. These, as they swell, exercise a constant and gradually increasing force, wrenching the blocks out of place. When a high wind blows the structure is racked through and through in every joint and keystone. Sooner or later, if nothing is done to remove the tree, this side of the wall will settle down into ruins. A tangle of weeds, grasses and creepers thickly carpets the precinct. Beyond the two small cross-walls on the inner side of the great outer wall on the south-west side is a remarkable slab, inclining to a crescent shape, balanced on two solid shafts projecting out of the masonry. This, when tapped, gives a clear ringing sound, and was probably used for an alarum or for a sort of a bell in sacred ceremonies. The north-west angle gives a happy impression of the style of architecture, the two walls at their junction running up high and bluff like the bows of a Japanese junk. Beneath, the terrace fronting the waterway is overgrown by a belt of young cocoa-palms of recent growth. News of the excavations, and of the havoc being made in the jungle in clearing operations, finally reached the ears of King Paul, who at once put a stop to the work. Most unfortunately, his superstitious terrors were confirmed by a very severe epidemic of influenza that broke out in the tribe shortly after their departure, and carried off many of the Metalanim people. The result of the excavations in the central vault was distinctly encouraging, and it was a great pity more time could not have been spent at it. Thoroughly to explore and clear the labyrinth of this Micronesian Venice and to make complete excavations would take several months' hard work. It was very difficult to get the natives to work here, owing to their dread of the vengeance of the ancestral spirits and heroes hovering around these holy places, ready to let loose some terrible judgment upon the head of rash intruders. Another great drawback to exploration likely to continue during the reign of King Paul is a deep-seated hostility to the white man felt by many of the Metalanim tribesmen.

MANCHESTER SOCIETY OF ARCHITECTS.

THE thirty-fourth annual dinner of this Society was given on the 8th inst. at the Queen's Hotel, Manchester. The chair was occupied by the president (Mr. R. I. Bennett), who was supported by Mr. George Corson (president of the Leeds and Yorkshire Architectural Society), Mr. Edward Salomons, Mr. Charles E. Bateman (president of the Birmingham Architectural Association), Mr. W. P. J. Fawcus (ex-president of the Northern Society of Electrical Engineers), Mr. W. A. Royle, Mr. C. H. Heathcote and Colonel Eaton. A telegram apologising for inability to be present was received from Professor Aitchison, R.A., president of the Royal Institute of British Architects. After the customary loyal toasts had been given from the chair and appropriately honoured, the President proposed "The Royal Institute of British Architects." The Institute, he remarked, was started in 1831, but it was not fairly founded until 1834, and it was constituted in the following year. At a later period the Institute was incorporated by Royal Charter. Its list of past presidents included such honoured names as those of Sir George Gilbert Scott, Charles Barry, Sir Horace Jones, Alfred Waterhouse, and last, but not least, Professor Aitchison, who enjoyed the distinction of being president for the third year in succession. The object of the Institute was the general advancement of civil architecture. It sought also to promote and facilitate the acquirement of the knowledge of the various arts and sciences connected with architecture. The Institute had a membership of some 1,600, and they had branches and corresponding members in every quarter of the globe. In Manchester the Society endeavoured to support and protect the character, status and interests of architects practising in or in the vicinity of Manchester, and to promote personal acquaintance and good feeling between the members of the Society, to regulate professional charges, and to establish educational facilities for younger members and students by means of classes, lectures, offering of prizes, &c. In the absence of Professor Aitchison, the task of acknowledging the toast was accorded to Mr. Charles E. Bateman, president of the Birmingham Association.

Colonel Eaton proposed "Allied Societies," to which Mr. Bateman and Mr. George Corson (president of the Leeds and Yorkshire Association) replied.

Mr. C. H. Heathcote, before proposing "The Northern Society of Electrical Engineers," alluded to the loss which the Manchester Society of Architects had sustained during the past year by the death of Mr. Bridgford and Mr. Sankey. In Mr. Sankey the Society had suffered a distinct loss, for he was a man who, if he had been spared, would have risen to a very high position—if indeed he had not already achieved high rank—and all the members united in sincere and reverent condolence with Mr. Sankey's relatives and, as it were, with themselves as his brother architects.

Mr. Fawcus (Northern Society of Electrical Engineers), in responding, referred to the arrangements in progress for developing the uses of electricity. It is proposed, he said, in the course of the next few years to spend between six and seven millions sterling on new works. Then electricity, instead of being a dear light and the luxury of the few, will be available at a far less cost than gas is now. Fivepence a unit was now charged, equal to about 3*s.* per 1,000 cubic feet of gas, but if Parliament granted the powers asked of it, the charge would be brought from 5*d.* to 1½*d.* per unit, and even less for motive power.

Mr. J. Ely proposed "Municipal Technical Education," which toast was acknowledged by Mr. J. H. Reynolds.

THE GLASGOW ARCHITECTURAL ASSOCIATION.

AT the usual monthly meeting of the Association held in the rooms, 187 Pitt Street, on Tuesday, December 6, Mr. Geo. S. Hill in the chair, Mr. John Watson contributed a paper entitled "Our Domestic Architecture." Mr. Watson confined himself to a general view of the types of building which went to form the suburbs of large cities. He traced the existing styles of plan to class of material used, prejudices arising mainly from economic causes. Mr. Watson showed by a large number of illustrations how different this class of building could be made if architects were but willing to adopt the many different materials which lay to their hands. This would in turn lead to improved types of plan and style of building generally. At the close of the discussion which followed Mr. Watson was awarded a hearty vote of thanks for his paper.

The Discussion on the paper read by Mr. W. Weaver on "The London Building Act and the Official Supervision of Buildings" before the Surveyors' Institution will be resumed on January 9.

NOTES AND COMMENTS.

We lately referred to some of the requirements of Parliamentary plans. Although they appear every year more or less abundantly, it is remarkable that their purpose is not entirely understood. The plans may show as much ground as the surveyors care to draw, but the essential part is what is comprised within the "limits of deviation." It might be supposed that every official of a corporation would know as much. But apparently not one member of the South Shields Corporation nor one of the engineering or legal officers was aware of a fact which might be said to be a part of the English Constitution. An Act was obtained in 1895 authorising street improvements in South Shields. When the arrangements were in progress for carrying out the work, it was found that more land was required than was shown between the limits of deviation on the Parliamentary plans. Thereupon, without having legislative sanction, they gave notice to a Mrs. Donaldson that it was intended to take some of her property. The lady applied to the Courts to restrain the Corporation from exercising compulsory powers to obtain the premises, and counsel had the hardihood to maintain that a more liberal construction of the law should be allowed in the case than was permitted to railway companies. It is needless to say Mr. Justice North at once granted the injunction, for the simple reason that the Corporation had no claim on any property beyond the limits of deviation. The conduct of the Corporation deserves to be brought under the notice of Parliament as a breach of privilege of the most serious kind.

Through the efforts of M. Formentin, the conservator, the new Musée Galliera in Paris is fast becoming representative of the modern decorative art of France. In order to adorn the walls the municipal authorities have lent several valuable examples of tapestry which have survived through many disturbances. A large number of decorative paintings, which are purchased from year to year, and which hitherto were stored in out-of-the-way places where they were visible to the storekeepers alone, are now to be seen in the Musée Galliera under favourable conditions which are not always obtainable for decoration. Then there are the *objets d'art* which are a specialty of Paris, and which were purchased like the paintings in the annual exhibitions. The sculpture is also excellent. The Musée Galliera, which as a work of architecture merits to be visited, may be considered as a rival to the Luxembourg, which recalls many Salon exhibitions and exemplifies several phases of modern French art.

An effort has been made lately to make out Lord Beaconsfield as a double dealer, because at the Academy banquet in 1875 he spoke of the faculty of imagination which distinguished the English School of late years. Browning, the poet, said that in the conversation after the dinner Disraeli, whilst looking at the pictures, said that they were most lacking in imagination. It is a pity that censors of a speech will not refer to a report of it, but to some hearsay evidence of its character. Disraeli might use opposite expressions without incurring a charge of duplicity. In his after dinner speech he referred to various sections of the English School. He spoke of the portraits, the landscapes and the paintings of the common incidents of life, but what has most, he said, "in my opinion, distinguished of late years the English School is the faculty of imagination." He then described how the faculty was developed under great disadvantages. In a characteristic passage he presented some of the drawbacks:—"The artist is not favoured by a climate of inspiration. He is not surrounded by a sublime nature. He does not dwell in cities glittering with symmetry, under purple skies. He is not surrounded by human beings whose flashing forms and picturesque gestures stimulate his invention, and often afford a happy hint of expression and of grace. For him there are no bannered processions parading the squares and streets of fair cities to animate his fancy amid the fall of fountains and the carolling of sacred bells. No, sir, he lives in a studio invaded too often by the London fog. If he walks forth for relaxation he wanders in streets of hideous monotony. His living studies are the constable and the cabman. Instead of a procession he encounters a blockade of omnibuses, and instead of bursts of harmony he is greeted by the scream of the Subterranean Railway, and the horrible concert of organs and hurdy-gurdies. And yet this man, by his imagination, by that divine gift alone, can give us a canvas breathing with human passions, in scenes of romantic loveliness and with every accessory of splendour and of grace." Such a speech might well be described by Mr. Watts as beautiful, but it referred to the English School in general, and was not intended to describe the works seen in 1875. In that year imagination was not supreme, and there was some magnanimity in the acknowledgment of Disraeli, that it did not bear out the roseate view he had taken of the characteristics of the School. To describe the difference as "devilish" or "hellish" is absurd.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ST. ALBANS: THE SCREEN.

We publish this week the second of the two screens which belonged to St. Albans Abbey. Tottenhoe stone was used in both. One divided the nave from the choir, and from its solidity and extent completely prevented any of the worshippers in the nave seeing what took place at the high altar, unless on occasions when the side doors were opened. The larger screen, which is credited to Abbot William Wallingford, resembles in treatment those of Winchester, Gloucester and St. Saviour's, Southwark. The cruciform space which forms the central part used to be occupied by a silver crucifix. In spite of vandalism, the ornament still suggests its original delicacy, but it is needless to say the figures in the canopied niches do not date from the fifteenth century.

COMMUNION RAILING, CANTERBURY CATHEDRAL.

The new communion railing, which is illustrated in the present number, consists of a broad-moulded continuous capping, having curved ends to terminate against piers of choir; this rests on a brass structure having for its chief feature a balustrade of moulded spindles divided into bays by upright pilasters on each side and between which are square middle panels. These pilasters have carved and pierced ornament, consisting of a conventional rendering of the acanthus springing from a vase and terminating in a cartouche, within which are oval medallions with monograms. The larger square panels above referred to have within wreaths the *iota eta sigma*, alternating with the emblem of the Holy Trinity. These panels are well chased and surrounded by carefully modelled egg-and-tongue moulding, and are backed by "opus sectile" mosaic in rich reds, jasper and azure, which material is also used in the panels of the base, where it embeds the angelic ascription with flanking roses. The whole is laid on a plinth of black Belgian marble. The gates are constructed with the same baluster treatment as the railing, with panels in the bottom rail designed to harmonise with the pilasters, but are left as open work (*i.e.* without backing).

The general character of the work is that of the English Early Renaissance, in the construction of which great care has been observed, having been substantially framed with H steel core in base and capping. The gate-framings are cast in one piece, and but few joints are visible in other parts. The material is practically bronze, an alloy having after several experiments been adopted which combined a pale brass colour with hardness and firmness of texture. All the plain surfaces are left unlacquered—to be regularly cleaned or left to acquire a patina surface, as may be determined.

The design and detail drawings were prepared by Sir Arthur Blomfield, A.R.A., and Messrs. Hart, Son, Peard & Co., Limited, of London and Birmingham, executed the work under his supervision. Messrs. Rattee & Kett did the carved work of the model from the architect's full-sized drawings, Messrs. Powell & Sons the opus mosaics, and Messrs. Earp & Hobbs supplied the marble plinth.

WRITING-ROOM, SAVOY HOTEL, STRAND.

THE LONDON BUILDING ACT AND THE OFFICIAL SUPERVISION OF BUILDINGS*

IN submitting the following short paper to the Surveyors' Institution, I am desirous of drawing attention to the London Building Act, and the manner in which it is carried out or enforced, with the view of considering the desirability of extending to London the system prevailing under the Public Health Act in the provincial towns throughout England. Included in the membership of the Institution are a majority of the surveyors connected with the development and management of estates both in London and the country, and such members especially should from their experience be in a position to institute a comparison between London and provincial procedure in matters of the kind.

Recent unfortunate events in London have had the effect of directing public attention to the Building Act and its alleged shortcomings, and although the aid of the law has been invoked in several cases since January 1, 1895, when the new Act came into operation, I consider it would be a slur on the many professional associations (including the Surveyors' Institution) which gave so much time and consideration to the Act when in Bill form to admit that its provisions if efficiently enforced are not sufficient for the general attainment of the end for which they were devised. Members are aware of the many alterations made in the Bill as the result of the consideration given to it and the very different appearance which it presents in the form of an Act, and it may be fairly assumed that even if the same amount of consideration were given to the amendment of the present Act, the resulting measure would still fall short of perfection and afford ample opportunity for the exercise of legal acumen and expert skill in the interpretation of its provisions.

I am of opinion that the remedy for the defects of the present official system of building supervision in the Metropolis must be sought, not so much in the direction of amendments to the Act itself as in the system of supervision adopted in enforcing it, and it is to this view of the question that I would particularly call attention. During my thirty-nine years' official connection with the parish, Kensington has developed from fields and market gardens into one of the most important districts of the Metropolis, and very exceptional opportunities have thus been afforded of acquiring practical acquaintance with the subject under consideration, not only in the particular district referred to, but in the Metropolis generally.

In the report of the London County Council for 1897, it is set forth that for the purpose of the Building Act the county of London is divided into 64 districts, each superintended by a district surveyor, whose duty it is (according to the said report) o see that all new buildings and all alterations and additions to buildings "are carried out in accordance with the law." This statement is not correct, for, as I shall point out, the district surveyors exercise no supervision outside the statutes governing their appointment.

The report of the Council further states that a standing order of the Council requires each district surveyor newly appointed or reappointed to devote the whole of his time to the duties of his office, and not to engage directly or indirectly in private practice. Of the existing district surveyors, forty-one can take private practice, twelve are precluded from private practice in their own districts, and the remaining eleven are, under the standing order above referred to, entirely precluded from private practice. The district surveyors are remunerated by fees in accordance with schedules attached to the Building Act, and during the year covered by the Council's last report these fees amounted to the sum of 47,748*l.* 10*s.* 4*d.* The Council has power, under section 158 of the Act, to substitute a fixed salary in lieu of fees, abolishing the latter and charging the salary to the County Fund.

Prior to the passing of the order prohibiting private practice, the office of district surveyor was sought, not so much for the direct income attaching to it, but for the opportunities afforded for enlarging the private practice of the official. A district surveyor acting as architect for a building in his own district is required to give notice of the fact to the London County Council, who appoint another district surveyor, generally from an adjoining district, to see that such building is erected in conformity with the provisions of the Building Act. After a short interval the positions are possibly reversed, and the first-mentioned district surveyor finds himself officially supervising the work of the *pro tem.* district surveyor in his district. There can be no doubt that it is bad in principle for any public official to be allowed to engage in private practice in any way connected with his official work, and doubtless the London County Council acted wisely when they passed their resolution prohibiting district surveyors thereafter appointed from engaging in private practice. It is somewhat curious, however, to observe how this restriction actually works. When a new district surveyor is required, candidates for the position are invited by advertisement, and in response applications and testimonials are sent in to the Council. Each candidate must have passed the qualifying R.I.B.A. examination; but beyond that equal gauge the comparative merits of the candidates are assessed upon the skill and ability they have shown in the past exercise of their profession, and in the result an architect is appointed who has established some reputation for designing and planning buildings, and the situation does appear somewhat ironical when it is considered that the newly-appointed surveyor must no longer exercise the talents which have secured him the appointment, but must, as it were, wrap them in a napkin and relegate them to unprolific burial.

The man who has gained a name for designing a good elevation and getting out a clever plan is forthwith to stifle his own aspirations and inspirations, and be content with looking after the height and thickness of walls, &c., and other dry provisions of the Building Act.

It is to be presumed that such self-sacrifice is loyally acquiesced in, but this castration of professional ability is for some reasons to be deplored. The training necessary for the production of a good architect is not required for and should be different from that of a building surveyor, in whose case the skill to plan and design, which is a necessity in the architect, is not so much required as a thorough acquaintance with building materials. A knowledge of strains and thrusts and of workmanship is much more desirable than expertness in the more artistic branches of the architect's profession.

In 1885, in response to an order of my Board, I presented a report embodying suggestions for improving the local public work of the Metropolis. Most of these suggestions have subsequently been carried into effect by legislative enactment, but among the recommendations awaiting adoption is one for the transfer to the local authorities of the Metropolis of the duties now discharged by the district surveyors. I am of opinion that public benefit and administrative economy would result from the adoption of this recommendation, and I strongly urge that, in any scheme for the reform of the local government of the Metropolis, the proposed district councils should be entrusted with the supervision of building operations in their several districts.

The policy of the proposed transfer has received the endorsement of the metropolitan vestries, as will be seen from the following statement of past action in the matter.

As a result of two meetings convened by thirty-four metropolitan vestries and district boards, and held at the Town Hall, Chelsea, a memorial was forwarded on August 5, 1890, to the Prime Minister, stating (paragraph 4):—

"That in the opinion of this conference the office and functions of the district surveyor under the Building Acts should be in the hands of the local boards and their officers, with an appeal to the London County Council."

On February 28, 1896, a conference took place between delegates from the London County Council and from the several vestries and district boards to consider, in view of contemplated changes in the government of London, what powers should be allocated respectively to the central and district authorities, and a resolution was carried similar in effect to that set forth above. The London County Council representatives did not vote on this resolution, and the committee of the Council subsequently reported adversely to the view adopted by the conference, and that recommendation of the committee has since been confirmed by the full Council. This line of action, however, was only to be expected, as the Council has always been opposed to parting with power, whilst showing a ready disposition to undertake new functions—the more important the better. On March 16, 1894, in giving evidence before the Royal Commission on the Amalgamation of the City and County of London, I submitted (*inter alia*) the following statement:—

"Upon the occasion of the delegates from the Conference on the Public Health (Amendment) Bill waiting upon the Local Government Board on June 25, 1891, the Right Hon. C. T. Ritchie stated that it was his desire and intention in the District Councils Bill, which he hoped shortly to introduce, to enlarge the scope of usefulness and responsibilities of the local authorities. In connection with such statement it may be fitly asked, What duty more desirable and important can be cast upon the local authority than the responsibility of seeing that the buildings within its district are erected in a sound substantial manner suitable for human occupation, with due regard to fire risks and health risks of the general community? As urged in the memorial above referred to, all such work should be vested in the local authority, as is the case in provincial towns. Drawings for each new building should be deposited, the intended drainage, depth of foundation, line of frontage, open spaces, water supply and sanitary arrangements should be clearly shown. Upon the said drawings being approved, the work should be executed under the supervision of the local authority, and on satisfactory completion a certificate given, which could be affixed inside the

* Apaper by Mr. Wm. Weaver, Fellow, read at the ordinary general meeting of the Surveyors' Institution on Monday December 12.

building. Such certificate would be of great advantage, both to the owner of and the individual contemplating residence in the house. Unauthorised alteration of the drains or sanitary arrangements, when completed as aforesaid, should be punishable at law. At the present time, after a drain has been completed, tested and passed by the vestry's officials, there is nothing to prevent the occupier or other person making, without notice, some alteration which may entirely destroy the perfection of the drain.

"In effecting any change on the lines hereinbefore advocated, Parliament would, of course, take care that no injustice should accrue to the present district surveyors, and the work of the future would have to be safeguarded by precautions being taken to insure proper knowledge and experience on the part of the officials undertaking the transferred duties. One of the risks under this head is in the case of small districts where the work is not sufficiently extensive or responsible to justify the appointment of a properly qualified man at a sufficient salary to give the whole of his time to his public duties. No public surveyor should be allowed to practise privately; the defects of such a dual system are well known and need not be dilated on here.

"The above difficulty (as to small districts) may be met by uniting two or more together, so as to create districts with a population of about 200,000 each. Such an enlarged district could afford to pay for the whole time of a properly qualified surveyor or engineer, who would have no difficulty in finding ample scope for the useful employment of his skill. The work of a fairly large district can be better and more economically executed than that of a very small district, especially where the local authority performs its own work instead of executing it by the aid of contractors."

It will be seen from the preceding extract that my desire was to protect the present district surveyors from any unjust treatment, and I would take this opportunity of assuring those gentlemen—many of whom I am pleased to count as personal friends—that I have always been careful when advocating the transfer of their duties, to emphasise the necessity of protecting their interests in the event of any change of the kind being effected.

It is possible, of course, that some individual cases of hardship may occur, but to any one acquainted with the building work of London it must be apparent that the duties of district surveyor and parish surveyor should be discharged by one official, corresponding to the borough engineer and surveyor in the towns throughout the rest of England. If the two offices were amalgamated the district surveyor would in some parishes probably be the best man to discharge the duties of the combined office, and in other parishes the present engineers and surveyors would be fully equal to the task. At any rate individual interest must not be allowed to stand in the way of public advantage, and if the latter demands a change there will be no more difficulty in getting qualified engineers and surveyors for the London district councils than is experienced in the large towns throughout the kingdom.

These points I strongly urged when reporting to my Board on the London Streets and Buildings Bill, as the following extract will show:—

(Extract from surveyor's report to the vestry of Kensington, dated December 27, 1893. Paragraph 57.)

"It is a bad system to have two district surveyors, one responsible to the Council and the other serving the local authority, and both going over the same ground and, to a certain extent, over the same work. The two officers should be rolled into one, responsible to the local authority, and discharging the same duties as now performed by the borough surveyors throughout the kingdom. The vestry will understand that the suggested amalgamation of offices is not proposed in the interests of the professional class of which I am a member, but is simply made in the interest of the government of the Metropolis. Many of the district surveyors are better qualified to undertake the work of the local surveyors than the latter are to absorb the functions of the former, but whenever such assimilation of officers does take place, properly qualified men would be appointed to each locality, and that without injustice to any present surveyor, district or local."

In view of the general unanimity of the present local authorities on the question, the members of this Institution can hardly fail to be convinced that it is for the advantage of the public generally and for the convenience of the profession itself that the proposed change of administration should take place. In support of the policy of change, I would submit the following considerations which have induced me to propose the suggested transfer of powers and amalgamation of duties under the Building Acts and Metropolis Management Acts.

I am distinctly of opinion that anyone desirous of developing an estate or erecting a building should be able to ascertain at the town hall of the district everything required by the public authorities relative to such building or estate. At the present time an applicant is informed on attending at the town hall that he must give the vestry seven days' notice before commencing the excavation of foundations, and must give concurrent notice to the district surveyor as to commencement of building operations, and submit drawings of the proposed buildings for the approval of the district surveyor; but the local authority has no power to call for such drawings, the seven days' notice to them being only required in order to afford an opportunity of serving a counter notice to keep the foundations up to a certain level, so as to insure proper drainage.

Should the applicant desire to develop some building land he is referred to the London County Council, to whom he must first submit (in duplicate) plans of intended roads. The County Council forward one of the copies to the vestry, and guided more or less by their recommendation, approve or refuse them. Having received sanction to his plan for laying out the roads, the applicant becomes anxious to construct sewers, and is then told to send in duplicate plans to the vestry, who upon approving them forward one copy to the London County Council for their sanction. After this double reverse process, generally taking considerable time, the applicant, having succeeded in getting his plans of roads and sewers passed, proceeds to build, generally constructing the sewer first, this work being carried out under the supervision and to the satisfaction of the vestry. The foundations of the buildings are then proceeded with, the vestry surveyor attending to look after the level and frontage line. Simultaneously the district surveyor attends to look after the foundation site with regard to the necessity for concrete and the thickness of walls and spread of footings.

The attendance of the vestry surveyor then ceases until the house drainage work is commenced, of which seven days' notice has to be given to the vestry, under whose supervision the whole of the work (in addition to water supply) has to be satisfactorily carried out. In alterations to buildings and in the erection of blocks of flats, building work and sanitary work will be found progressing simultaneously, and the district surveyor may be found looking after the proper construction of a wall, while the vestry surveyor is seeing to the soil-pipe attached to it. Generally speaking, in the majority of buildings, the drainage work is executed after the carcase of the building is completed, and it may be found, as in past cases, that the building, though erected in accordance with plans passed by the district surveyor under the Building Act, does not conform to the by-laws framed under the Public Health Act by the London County Council, and enforced and supervised by the vestry. Several such cases having occurred in Kensington, the London County Council were requested (March 16, 1894) to furnish the district surveyors with copies of the by-laws under the Public Health Act with an instruction not to approve plans submitted to them under the Building Act when such plans showed intended violations of the Council's by-laws. The Council in reply (April 14, 1894) considered it inexpedient to give such instructions to the district surveyors, whose duties were prescribed by the Building Acts. In consequence, at present it occasionally occurs that notice has to be served by the vestry requiring a newly-built structure to be altered and amended in order to meet the requirements of the Council's by-laws.

Further overlapping supervision and occasional clashing arise with respect to lines of building frontage and the laying out of new streets, and also in relation to arches or vaults under public ways. With regard to the former, the district surveyor is entitled to special fees under Section 155 of the Act, and as to the latter the fees are fixed under Schedule 3, Part I., of the Act.

Concurrently with the district surveyor's supervision of frontage lines and of the laying out of new streets, the vestry's surveyor is exercising similar supervision, with the additional work of setting out the levels of the new streets and their intersections. With regard to vaults under footways, the district surveyor's duty is limited to looking after the brickwork in relation to the span of the arch, and he has no power to disapprove any work provided it fulfils the conditions laid down in the Building Act, but the vestry's requirements, which their surveyor has to enforce, may demand 50 per cent. thicker head walls set back 2 feet from the kerb line, backed up with concrete, with 2 feet of space for electric, gas and water mains, &c., left between the crown of the vaults and the paving.

Again, with regard to setting back buildings to be erected on open spaces within 20 feet of the centre of the road, both the district surveyor and the parish surveyor have corresponding duties, and it occasionally happens that the former, in approving building plans submitted to him, loses sight of the fact that the abutting highway is under the full width, and the parish surveyor has afterwards to stop the building in progress.

If the work of the proposed new District Councils for London followed the course of procedure adopted in all other towns throughout England, these difficulties and cases of overlapping jurisdiction would not occur. In Leeds, Birmingham, Manchester, &c., by attending at the borough or town surveyor's office, anyone can obtain all information necessary for his guidance in carrying out any building operations, and the

advantages of this simplicity of procedure should not be denied solely to the metropolitan districts, many of which at the present time exceed in population and rateable value most of the provincial towns possessing the advantage of self-government.

Another difficulty under the present system in London arises from the district surveyor having no knowledge of or responsibility as to the sewers. Plans for buildings at the rear of old houses are approved by him, notwithstanding the existence of sewers running under the site of the new building, which it is illegal to erect in such position, but which unless discovered by the vestry within six months from completion cannot be demolished. The connection of the district surveyor with any new building ceases on its completion and the payment of his fees; there is no subsequent periodical inspection to detect violations of the law after the completion of the building. If such inspections were made I suspect that many infringements of the Building Act would be discovered, notably the erection of sheds and buildings in backyards, with consequent increased fire risks and reduction of air space. If the Building Act was administered by the local authorities the drawings of each building would be lodged with them; such drawings would show the situation and construction of the building, its drainage, sanitary adjuncts, water supply and open spaces attached to the premises, and the present officers to the local authorities in making their regular inspections at short intervals would be able to note any recent alterations to the premises.

As before stated, the district surveyors are remunerated by fees, out of which their assistants have to be paid, and it is unreasonable to expect the surveyor to provide and pay a body of perambulating assistants to the serious diminution of his net income. I believe I am correct in stating that most of the cases of dangerous structures are notified to the district surveyor by the vestry surveyor, and it must be borne in mind that the district surveyor is not entitled to charge his fee for surveying any dangerous structure until directed by the Council to make such survey, as under Section 103 of the Act the existence of the dangerous structure must be notified to the Council before an instruction for its survey is given by them. Under the present system too much is left to chance; it is nobody's duty to find out or discover dangerous structures, and the collapse of a building may be the first intimation of its dangerous condition.

I am of opinion that no fees should be charged in respect of new buildings or dangerous structures. At the present time the supervision of drainage and sanitary work, water supply and regular sanitary inspection are undertaken by the local authority and the expense thereof borne by the rates, and I fail to see any sound reason why one principle should not apply to the whole work of supervision.

In amending the local government of the Metropolis, it is very desirable that the responsibilities and duties of the District Councils should be enlarged beyond their present scope and limitations, in order to dignify the position of the members and raise the status of the chief officials. The latter should not, of course, become the masters of the councils, but at the same time they should be able men, fitted to discharge their duties fearlessly without sacrifice of independence.

In support of my opinion as to the desirability of raising the tone of local administration I would refer to the report of the Royal Commission on London Government (hereinbefore alluded to), and to the remarks made on June 25, 1891, by the Right Honourable C. T. Ritchie on receiving a deputation of delegates from a conference on the Public Health (Amendment) Bill. Mr. Ritchie, as I have mentioned, stated that it was his desire and intention in the District Councils Bill, which he hoped shortly to introduce, to enlarge the scope of usefulness and responsibilities of the local authorities. The report aforesaid of the Royal Commission states (page 17):—

"Paragraph 47. We have now to consider what the functions of the new Corporation should be and its relations to the subordinate local authorities, especially to that of the old City. As we have already intimated, we think the resettlement of the government of the old City should be made on lines which are capable of being more or less rapidly adopted in the other component parts of London, so that the organisation may be regarded as an example to be followed."

"Paragraph 48. In developing this principle we think that everything possible should be done to maintain the strength, authority and dignity of the local bodies of London; and that in the partition of functions between the Corporation of London and local authorities the former should be relieved of all administrative details for which its intervention is not really necessary, and the latter should be entrusted with every duty they can conveniently discharge. In the case of doubt our inclinations would lean to the allotment of functions to the local bodies, and we believe that in cases where uniformity of action is necessary, this may often be best secured by giving to the Corporation the authority to frame by-laws which should be locally administered, with provision, however, for the intervention of the Corporation to secure their enforcement should they be neglected."

I therefore submit that the interests of the community would be served by casting upon any new District Councils, to be created for the future local government of London, the duties now discharged by the district surveyors under the London Building Acts, and that the cost of carrying out such duties should be a charge upon the general rate of each district.

Finally, I beg to assure the members of the Institution that in recommending the foregoing alterations or reforms I have no personal object to gain—my official career is rapidly approaching its termination—and I simply place my views on record as honest convictions resulting from a life's working experience; and I am strongly of opinion if the District Councils Bill for the improvement of the local government of the Metropolis is shortly introduced (as promised) into Parliament, it should provide for the single, complete, systematic and regular supervision of all buildings on the lines I have advocated.

THE TAVISTOCK ROAD COMPETITION, PLYMOUTH.

At the opening meeting of the third session of the Three Towns Branch of the Devon and Exeter Architectural Society at Plymouth, Mr. Charles King presided. There were present Messrs. M. Alton Bazeley, W. N. Richards, J. H. Dwelley, W. T. Pethick, H. E. Roskruge, B. Priestley Shires (hon. sec. and treasurer). Letters of apology for absence were received from Messrs. E. Coath Adams, W. H. May and H. G. Luff.

The Hon. Secretary, in his third annual report, stated that steady progress had been made. The greater part of the time available had this year been occupied with the discussion of certain phases of the competition question in a very practical form, which had been more particularly brought home to them by the competition for the Tavistock Road building scheme, initiated by the Corporation. During the year many meetings on this subject had been held, and a deputation, composed not only of members of their own Society, but including others, representing the whole of the practising members of the Three Towns, had waited on the town clerk; a great amount of correspondence had passed, and a memorial, numerously signed, had been presented. But, after all, the negotiations fell through, the result being that with one exception no practising architects of the Three Towns competed, in consequence of the conditions not being in accordance with architectural practice. Their objections to the terms of the competition were very reasonable indeed. The promoters required full detailed working drawings for about one-fifth of their proper market value, and naturally they declined to have anything to do with a competition on such lines. Their case had been well ventilated through the local Press. They had not the slightest doubt that the step they took was the right one. They were supported by the architects of Devonport (with the exception referred to), by the Council of their parent Society at Exeter, by the whole of the architectural Press, and by the Royal Institute of British Architects, who, he understood, very recently decreed that it was undesirable for a member of the Royal Institute to act as assessor in the Tavistock Road competition on the existing conditions. The outcome of this was that Mr. Crickmay, who was appointed to act as assessor for the Corporation of Plymouth, respectfully declined the appointment. The remainder of the report recorded the election of Mr. H. G. Luff (Devonport) to the vice-presidency of the Society, and the election of Mr. Priestley Shires on the Council; the interesting visit to Oxford in June; the viewing of the new Palace Theatre, by the invitation of Messrs. Wimperis & Arber; and the hospitality of Mr. James Hine, ex-president of the parent Society and ex-president of the Devonshire Association, in entertaining members at Launceston; congratulations were offered to Mr. G. H. Fellowes-Prynne, who was this year guiding the affairs of the Architectural Association of London; to Mr. Harbottle Reed, hon. secretary at Exeter, on his success as the Grissell gold medallist for 1898; and to Mr. M. Alton Bazeley on his election to the Plymouth County Council; and expressed the hope that many of their members would in future endeavour to secure some of the very valuable prizes and travelling studentships in connection with the Royal Institute of British Architects.

In moving the adoption of the report, the Chairman said that during the heat of the recent municipal elections, a member of the Plymouth County Council attacked their profession generally, in stating they had formed themselves into a kind of trades union in order to bring undue pressure to bear upon the Council in connection with the Tavistock Road competition, that their action had considerably delayed the progress of the work, and that altogether they had placed themselves in a position which was not one of credit to them as professional men. That was answered very fully at the time, an anonymous letter appearing in the newspapers in reply to Alderman Radford's charge, while at ward meetings Mr. Bazeley was able to deal

with it. He was very anxious that the action they took at that time should be clearly understood. It was not an aggressive action. Proceeding to detail fully the circumstances, the Chairman remarked that the competition was, in the first instance, confined to architects practising in Plymouth, and the premium was fixed at 150*l.*, to be awarded by the special works committee. The unfair nature of the competition was recognised by the whole of the profession, some of the strongest remarks coming from the youngest members, and they were represented to the committee. The committee subsequently replied that they were willing to increase the premium to 250*l.*, but must retain the assessorship in their own hand, and have possession of all the working drawings, which would enable anyone with any knowledge of the building trade to complete the work without professional assistance. As they declined to accept the conditions, the competition was thrown open at the premium of 250*l.*, the assessor to be appointed by the President of the Royal Institute of British Architects, which the committee had previously refused to grant. Throughout it all they kept quiet, and had not made any fuss or represented themselves to be injured parties, but had simply adhered to their position, that as professional men they could not possibly accept the terms laid down. Their action was endorsed by the Royal Institute of British Architects and by the Council of the Devon and Exeter Society. Throughout the correspondence they had made a point of being as courteous and conciliatory as possible, and had recognised and acknowledged that the Council had shown them a kindness in the first instance by limiting the competition to Plymouth. He was anxious that in regard to anything transpiring in the future out of their action they should act as reservedly as they had done in the past. Very likely a few younger members of the profession would like them to act more aggressively; but it would be wiser and more judicious to follow the line already taken, so that whatever might be the outcome of the competition, they would be able to show they had simply done their part, and what they believed to be their duty in placing the profession generally on its proper basis in the mind of the public.

Mr. Dwelley, who remarked that the stand taken was a perfectly right one, seconded, and the report was adopted. The report of the treasurer, showing a balance in hand, was also passed, on the motion of Mr. Bazeley seconded by Mr. Richards.

The Chairman flatly contradicted the assertion that Mr. Bazeley was nominated in their interests to represent their views in the Council. As a body they knew nothing, and personally he was unaware of Mr. Bazeley's candidature until it was announced.

Mr. Priestley Shires observed that their recent attitude towards the Corporation was of not merely local interest, and would have an effect upon other municipalities and competition promoters. It was rare for architects to be so united as they had been over that question.

Some discussion followed as to the desirability of inducing more interest in the Society on the part of younger members, and it was also agreed to hold a dinner next month.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first monthly meeting of this Society for the present session was held in the library at the National Museum of Antiquities, Edinburgh, on Monday evening, Professor Duns, D.D., in the chair. The first paper read was a notice of the Priory Church of Ardchattan and its carved stone monuments, and of a group of carved slabs on the island of Inishail, Loch Awe, by Mr. Robert Brydall, F.S.A.Scot., of St. George's Art School, Glasgow. There seems to have been an early religious settlement at Ardchattan, probably founded by St. Chattan, about a century after St. Columba. The priory for Benedictine monks is said to have been founded by one of the Macdougals of the De Ergadia family, about 1230. Of the priory church and the monastic buildings but few architectural features are left, and the chief interest of the place lies in its ancient monuments, which though frequently referred to, have not been previously described and illustrated in detail. One fragment of a cross-shaft shows the ancient arms of the Macdougals on one side, and on the other a finely floriated pattern, resembling that on the tombstone of the Four Priors at Iona, and from a partially illegible inscription is supposed to commemorate a Macdougal prior of Ardchattan. Another monument, in the form of a very finely carved coffin-slab, commemorates the sons of Somerled Macdougal, Duncan and Dugal, successive priors of this monastery, together with their father and mother and their brother Allan, and adds that Dugal, the maker of the monument, died in 1502. The inscription goes round the margin, and one line crosses the stone in the middle, dividing the carved surface into an upper and lower half. In the upper half are three panels, each containing a figure in a Gothic canopy. In the centre is a skeleton figure emerging from the grave-clothes arranged round it as an ellipse. A very remarkable feature is the clearly-cut figure of a toad placed between the femoral bones. On either side is a figure habited in the dress of a religious order, in attitudes of grief. The three panels in the lower half of the stone also contain figures. At one side is a warrior wearing a pointed bassinet with a camail and a quilted surcoat, and holding a claymore. In the centre is the figure of a lady in fifteenth-century costume, and at the other side a knightly figure clad in armour appearing in Lowland effigies of about the middle of the fifteenth century—a rare type on West Highland monuments. The figures on this stone are unusually well designed, and better executed than the generality of the work on other monuments in the West of Scotland. Another interesting monument here is a cross-shaft of much earlier date, with ornamentation of divergent spirals, interlaced work and fretwork, recalling the style of the illuminations of the best Celtic manuscripts of the Gospels, like those of the Books of Kells and Durrow. A number of other monuments were described, and drawings of all the more important of the groups of carved stones, both at Ardchattan and on the island of Inishail, in Loch Awe, were exhibited. Drawings of the cross on Inishail and a photograph of an outlined rubbing of the cross-slab at Ardchattan were also exhibited by Mr. J. Romilly Allen, with remarks on the ornamentations.

In the next paper, Dr. D. Christison, the secretary, gave an account of the results of the excavation of the fort on Castle Law, near Abernethy, Perthshire. The excavation of this fort had been carried on for about three years in their leisure time by two residents in Abernethy, Mr. Alexander Mackie and Mr. James Marr, and when recently visited by Dr. Christison and Mr. Balfour Paul, on behalf of the Society, it was seen that one of the most interesting forts ever brought to light in Scotland had thus been unearthed, and by the aid of the Society the excavation was completed last summer. The position of the fort on a terminal spur of the Ochils is strong by nature, and the defences being substantially built of stone, give an impression of unusual solidity and strength. The shape is an oval, of 136 by 51 feet, enclosed by a wall varying from 18 to 25 feet in thickness, and still standing to a height of from 5 to 8 feet, although before the excavation was begun the whole of the structure was concealed under an almost level green sward. An outer wall, nearly of the same size, fortifies the end which is not protected by the steep hillsides. Both walls are dry-built, but have been ingeniously strengthened and bound by logs of wood built into the substance of the wall, both longitudinally and transversely. The wood has completely decayed and the spaces in the face of the wall formerly filled by the ends of the transverse logs now appear like rows of port-holes about 2 feet apart, while the spaces left by the decay of the logs laid longitudinally appear like channels running lengthwise along the wall in the midst of the rubble. This system of construction had been observed previously in the cases of two stone forts in Scotland—Burghead and Forgandenny—and is not uncommon in the Gaulish forts in France. It was a curious fact that neither at Forgandenny nor at Castle Law was there any indication of an entrance-way through the part of the wall that remained standing. The access must therefore have been either over the wall or through a gateway at some height above the base of the wall. For water supply they had the small loch below the hill, and had also a rock-cistern within the fort. The relics found during the excavation, as described by Dr. Joseph Anderson, consisted of a finely polished stone axe and two lamps of stone, a bracelet and a ring of jet, a deer-horn handle of a knife or dagger, a spiral finger ring of bronze and a bronze fibula or safety-pin of pre-Roman Iron Age type, a number of fragments of iron implements much corroded, some pieces of very rude pottery and two sling bolts of burnt clay.

In the next paper Mr. Thomas Wallace, Inverness, described a number of antiquities of various kinds which he had examined in Enzie, Banffshire. Among them was a stone cup found on the farm of White Stripe, which had its under side grooved by use in sharpening pointed tools. Two stone circles on the same farm had been destroyed and the stones used in building the farm-steading and in improving a ford. At Gollachy he noted a bronze axe and a fine flint arrowhead found in the same field, and at Presholme a bronze axe and spear-head from the same district.

In the last paper Dr. Joseph Anderson called attention to a Highland brooch of silver, ornamented with niello, which was lent for exhibition by Mr. T. S. Omond, and had been brought from the neighbourhood of Inverness to the late Dr. Traill many years ago. Its large size and elaborate ornamentation on both sides made it specially interesting as a fine example of a kind of artistic work in silver and niello which was once common in Scotland, though now extinct. He also described a set of three jet buttons found in association with one of two Bronze Age burials, discovered in excavating for a water supply at Keith Marischal, East Lothian.

Sheriff Mackay described a silver seal of Thomas de Rede, bearing a chevron between three branches or reeds, supposed to have belonged to one of the Redes of Redesdale, and now presented to the Museum by Miss Langland.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at Conduit Street, Mr. G. H. Fellowes-Prynne, president, in the chair.

Mr. W. Milner was elected a member of the Association.

It was announced that the lectures on "Drainage and Water Supply" by Mr. Max Clarke would commence on January 5, 1899.

Mr. Edwin T. Hall read a paper on

The Position of Architecture among the Fine Arts.

The subject on which I essay to address you this evening is one of so wide a range, a subject on which so many books have been written, that I cannot hope to treat it fully in the limited time at our disposal, but only rather to suggest matter for reflection; and I must at the outset ask your kindly and patient consideration for my shortcomings.

In approaching a subject like this one is at once face to face with the necessity for definitions, and the two at the base of our fabric are:—What is fine art? What is architecture?

I suppose we are so used to these terms that we feel rather a shock in being asked if we really understand what we confusedly know. Fine art has been defined as that power whose great end is to give pleasure, and the pleasure we have in contemplation is the higher or intellectual to the exclusion of the lower and sensual. The vehicles by which this higher pleasure is conveyed to us are of course the senses, so that we get sensuous and intellectual, or reflective pleasure. By hearing and by seeing fine art is appreciated, and the pleasure it affords is the greater in proportion to its permanent retention by the intellect, and in proportion to the tranquillity with which it is so conveyed.

Fine art has been also defined as the representation of an intended idea, the expression of an idea in matter, while the ideal in art is the rejection of a rude and crude act to illustrate an emotion and the selection of a more subtle and poetic mode of illustrating the idea.

The definition of architecture varies almost with every writer on this subject, and one is sometimes appalled to hear the courage with which a young architect speaks, and, with the confidence begotten of enthusiasm, lauds this building as good architecture, and decries that as devoid of architecture. What is this art of architecture? Mr. Ruskin says in one place "it is a science of feeling more than of rule," in another it is that which "taking up and admitting as conditions of its working the necessities and common uses of the building, impresses on its form certain characteristics visible and beautiful, but otherwise unnecessary." So that in his view architecture is a gloss separate or separable from the building.

Mr. Fergusson defines architecture as "the art of ornamental and ornamented construction." To emphasise this he says that in a building it is the art of the engineer which consists "in selecting the best and most appropriate materials and using them in a scientific way, and where the engineer leaves off the art of the architect begins." In other words, the planning and the constructional design of the building are works anterior to the "architecture" of it, this being a superimposed ornament. Indeed, he gives us an illustration of a building, and shows how he adds architecture to it. M. Viollet-le-Duc takes a different view. He says, "Architecture and construction must be taught together. Construction is the means, architecture the result. Architectural construction is the employment of materials according to their quality and their adaptability with the idea of satisfying a want by the most simple and solid means, giving to the constructed object the appearance of durability and proper proportion subject to certain rules imposed by the senses, reason and human interest." Briefly, a building must be devised by one mind so using construction as to result in a work of architecture described as having specified æsthetic properties.

Mr. Eidlitz's definition is less involved than that of M. le-Duc, and carries the point further. He says, "Architecture is the art which models buildings, which teaches the development of structural forms, the word development comprehending the continuous evolution of architecture as distinguished from its crystallisation into styles.

Mr. Statham, in his recent work on "Architecture and the Poets," defines architecture "from one point of view as the realisation of an imaginative conception in composition and outline; from another as the craft of building."

The first part of this, it seems to me, is well stated, and it might be added that the architect sees mentally the completed building beyond and through the veil of his drawings. The latter definition, however, appears to me to be involved in the former, because, as Viollet-le-Duc says, the craft of building is merely the means used to attain architecture, which is the end. A drawing can never faithfully represent a building; the depicted block lacks density and an aerial separation from its surroundings. To us who pass our lives among drawings they become a sort of shorthand, and are intelligible in a way they can never be to the uninitiated.

Hegel defines a work of art as the interpenetration of matter and thought. Viewed in this light, the matter in an architectural production is so relatively massive and intractable that to penetrate it with thought is the goal for which we must laboriously aim, and he who can subordinate the material to the mental in such a production is entitled to rank as an artist, and to rank higher than other artists in proportion to the difficulties of the material in which he has to express his ideas as compared with those in which they have to work.

Having endeavoured shortly to put before you some conceptions of fine art and architecture, I will ask you to consider with me the relations of the fine arts one to another in their mode of expression, and from this to endeavour to find what is the best rule of life which will help us most to carry forward the banner of our own art.

We shall speak of the arts of music, poetry, the drama, painting, sculpture and architecture. Of these painting, sculpture, poetry and the drama are imitative, music and architecture creative.

As ideas in art must be expressed in language understanded of the people, it is essential to convey the artist's meaning by depicting something in imitation of or based on principles observed in nature, that is in real life. That this is done in painting, sculpture and the drama is self-evident, but it is also the same in poetry. The poet's conceptions are descriptive of man or of some other work of nature, and the vivid portrayal of the scene or effect desired is a measure of the artist's power. Thus in the "Iliad" and Odyssey," Homer's gods and warriors and women are pictures appealing to us by our power to realise them, and the more subtle pictures of poets' thoughts are conveyed by imitating that which we can grasp from general knowledge.

All the imitative arts may raise the subjects they depict from the commonplace to the ideal, and the abler the artist the greater his success in this direction.

Music has nothing to imitate. It is a spontaneous creation, and it may convey to the mind suggestions of anything or everything in nature.

It is probable that music of a kind is almost as old as speech, and we know that at least thousands of years ago musical instruments were used. There are representations of such instruments on Egyptian monuments, and we have descriptions of them in elaborate variety as in use in Assyria and Babylonia.

The European music of to-day, the opera, the oratorio, are but a few centuries old. These originated in the fifteenth or sixteenth century, at the time of the great Renaissance. From the exhibitions we had in London a few years ago of Japanese music, it would seem that in the extreme East no such development has taken place. That music is but a rhythmic cadence of few tones.

Here it has attained such a development that it speaks to us in a language of its own, quite apart from words. It portrays all emotions. But it seems to me it differs from all other arts, in that it is almost incapable of pandering to the lower passions.

It is perfectly true that, used with the accompaniments of words and dramatic action, it may and does minister to sensual taste; but alone it breathes a purer air and tends always to refinement.

Luther says, "Music is the grandest and sweetest gift of God. Satan hates music; he knows how it drives the evil spirit out of us." And many of us can speak of our own experience how often in the battle of life, when we have been almost in despair, music has calmed and softened and elevated us, faith and courage have revived, and we have been re-nerved to greater exertion.

Poetry would appear to be of later origin than music, in that its aim has been to depict that which pre-existed in the human history, or prophetically to discourse of that which is to be. It is the adornment of expressed thought in any form. We recognise it in descriptive histories, and probably no more poetical piece of writing can be found than the Book of Job, written many centuries before Christ. It is a book which Mr. Froude, the historian, goes so far as to say "will one day perhaps, when it is allowed to stand on its own merits, be seen towering up alone, far away above all other poetry in the world."

The influence of poetry on the race is diverse. It may exalt or elevate the soul, it may debase it. Poetry, being a form of speech, can be artistic while it panders to the lowest of our natural appetites.

The drama is a form of poetry depicted by action. Whereas the epic poem appealed to the ear, the drama appealed to

eye and ear by a more vivid and realistic representation, exciting more profoundly the interest of the audience. In historical sequence it was later than either music or poetry. Probably its date is the sixth or seventh century B.C. Its influence is great, but it is evanescent. It is an acted sermon whether its aim be high or low. It is taken not as daily food, but as an occasional tonic.

We now come to that art which is primarily the subject of our consideration to-night, and as such we must consider it in greater detail than the other arts. I propose to consider it together with the sister arts of painting and sculpture, as they have been so intimately associated with it.

When the necessity first arose for man to build in order to protect himself from the elements or his natural enemies, his buildings would take their form on strictly utilitarian lines, using the material readiest to hand. Thus in a timbered district a conical hut of wattles covered with leaves would be the first form of shelter—suggested by the drooping branches of a tree—and in an arid or stone district the earliest form would be doubtless the excavation of a hole under a large flat surface slab, the sides of the excavation being lined with stones to support the edges of the large slab and prevent it slipping or causing the earth on which it rested to give away under its weight. Many such can be seen in Brittany to-day.

As the family or clan increased and with its increase the feeling of greater security obtained, the wattle hut would give way to the larger timber room, and the burrow would be replaced by the building up of stones above the earth to form a walled enclosure.

The existence of large flat stones would suggest the formation inside the enclosure, against its outer walls, of a portion covered with flat slabs supported by pillars of stone on the inside, and this feature in principle is preserved to this day in the cloister or ambulatory of courtyards and ecclesiastical buildings in the West, as well as in the older buildings of the East.

In Iceland a large native house is now but a series of detached wooden rooms joined together by a corridor.

The high-pitched roof arose in countries of heavy snows, and a wise conservatism retains it in variable climates. The accessible flat roof belongs essentially to the tropics or hot climates, its purpose being to afford opportunities for getting the greatest amount of air by day or by night.

Architecture was born when, in the contemplative mood of leisure, the man of the stone enclosure began to reflect that the pillars of his colonnade might be arranged not at the distances necessary to support the various sized stone slabs which came readiest to hand and were used as covers, but at regular intervals, selecting his cover stones to suit, and that he might reduce the rude outlines of his pillars to regular shapes; and the man of the timber house began to think that he might, instead of having a lot of detached rooms, put them together under one roof, and when they were so joined might remove the separating walls of some and place pillars in their stead.

Gradually with the process of political and social education which taught him and his neighbours to live in mutual dependence would come the recognition of the necessity for order and organisation, and these applied to the home would develop the architectural faculty of convenient planning, and so on until the rude congeries of rooms would become an architectural entity, symmetrical and rhythmic, and thus would be evolved what Fergusson calls "the æsthetic form of the technic art."

A further development would arise when assured of the stability of the commonwealth. Man, in contemplating the grandeur of nature, the sublimity of its outlines, the mystery of its forests, the dignity of its rocky terraces, the massing of its lights and shades, would reflect on the mysterious powers which dwell in these, and on the laws which control the seasons and the storms, and a desire would arise in him to do honour to the Unseen Author of these mysteries by erecting a temple. In such a building the narrow limitations of domestic life would have no place, and the architect, attuning his mind to this great Author, and finding within himself a reflex of that Author—a creative power—would reverently set himself to produce a work which should, in however dim a fashion, reflect the emotions with which nature and his subject had impressed him.

In such a structure there would be no place for the lighter moods of life. The predominant key would be dignity; its harmonies repose, mystery and symbolism; their combination appealing to mankind in its contemplative mood, conveying an expression, as Ruskin calls it, "often serious and sometimes melancholy—an equivalent for the sorrow, trouble and mystery of human life." It is by gradual process we thus see the art of architecture vivifying the dry bones of construction and making them live and speak. This spirit once aroused would permeate the world.

The palace would come next, in which the oratorio would be replaced by the opera, expressive of the various phases of life. The broad outlines of the structure would be representative of the dignity of life as a whole. Subordinated to this, the various parts would appropriately express the lighter moods.

In the temple the mysterious attributes of the Deity would be symbolised and the phases of His worship expressed. In the palace the glory of the man would be emphasised and enhanced, so that the stranger should be impressed with his majesty and importance. The enclosure would mark that the king's abode was set apart. Through its stately portals, as through a frame, the eye would be led to contemplate the picture within, and a visitor conducted for the first time through its courtyards and vestibules, its colonnades and halls furnished with the pomp of armed guards, the peopled bustling of a busy place, would be emotionally affected, his senses impressed and his mind prepared by the time he reached the hall of audience to render homage to the master mind. The effect I have endeavoured to sketch is recorded of the Queen of Sheba when she had been conducted through King Solomon's palace and had seen its magnificence, "There was no more spirit in her."

From the palace the spirit of architecture would through the ages percolate downwards, its steps growing slower and its form attenuated as it receded from the centre of wealth and leisure, of culture and refinement, until it would evaporate at the abodes of grinding poverty, at the factory where Mammon alone was worshipped.

And here parenthetically I would dare to dissent entirely from Mr. Ruskin where, in the "Seven Lamps," he inveighs against the external artistic treatment of trade premises. He says you must not mix architectural ornament with business, but should only use it for places where you rest. I venture to affirm, on the contrary, that in the refinement of the tradesman's surroundings there is most hope for raising the artistic standard of his wares and fabrics, and indirectly of his customers. It seems to me that the external treatment of every building is a matter of the deepest concern to the man in the street; indeed, every building owner in a city should be encouraged to recognise his responsibility in the architectural treatment of his building as part of the whole street, just as in his moral conduct he has a responsibility to the community.

Architectural ornament is to building as the leaves and blossoms are to the structure of a tree—an artistic development of the skeleton evidencing life—a perfecting. But, like the leaves, it should be characteristic of, and in harmony with, the structure within.

The relative position of architecture among the associated arts of painting and sculpture may be likened to the relation of trees to flowers. The trees are the more stately, the broad features which give dignity and masses of subdued tone to a landscape; the flowers the decorative colour and brightness.

The tree in its perfection is, so to speak, a part of the landscape. Painting and sculpture are more like the flowers of the earth, bright, poetical, refined. They must be examined near and in detail. They are the companions of leisure and of ease, while an architectural composition is for him who runs to read, for the virile man, the man of activity. So that for a monument to record a great victory or a national achievement, an architectural building is appropriately the medium almost universally chosen, while the sister arts are selected to record a pageant, an act in the great drama—in short, to depict the detail rather than the mass.

Architecture seeks to express the more permanent in nature; sculpture and painting the more evanescent, the ever changing.

The picture, too, has a frame to enclose it, to remind the onlooker of its limits. A work of architecture has its own proper place under the vault of heaven, and calls out that it is part of the actual.

Now, to be of any living and vitalising value we must bring home architecture to our daily life and surroundings. I ventured last autumn, in speaking to your President's address, to suggest a doubt as to the wisdom of teaching architectural history in the early stages of the Architectural Association curriculum, and proposed rather that the student's mind should be first trained to understand the principles of art and of design, not only by studio work but by the study of buildings, the history coming later when his trained mind would know better how to appreciate it. Shortly afterwards the Bishop of London, discoursing to teachers of the School Board on learning, said it was useless to start a child's education with the Witenagemote, and that it was better to teach him constitutional history by starting with the actual around him—with the policeman whom he knew—and from the present to lead him back step by step, by which means, said the Bishop, he could learn to appreciate history and so get back to the cradle of our constitution. I feel that is our best position.

We should strive to learn the principles constituting the basis of design and to apply the knowledge of construction we possess now—a knowledge wider far than any possessed by the ancients—to meet contemporary wants.

Do not suppose I am belittling the study of history or deprecating research. These are of immense value to an architect, but one may be learned in them and never be an architect.

Nothing is more cramping or sterilising to the mind than,

by becoming saturated with history, to become the slave of "style," be it Classic or Gothic or anything else.

To design in a recognised "style" is to arrest all art progress; to always seek for and follow a precedent, be it for grouping or outline, for planning or moulding, is the negation of art. It is living in the dead past, in a world whose aspirations, whose moral life, whose callings have but little relation to those of our day.

Mr. Fergusson tells us what are the "correct" proportions for a room; others what are the correct proportions of a column, of an entablature, &c. As Mr. Eidlitz very properly remarks, "If rules of proportion existed, and a knowledge of them enabled men to produce great architectural monuments, architecture would become a trade and not an art."

My younger friends will say all this is true, but so true that it is unnecessary to speak of it. But I would ask them to look around, to study the buildings only within the earlier years of this century, to read, when they have nothing better to do, the literature of the Battle of the Styles fifty years or so ago.

Mr. Ruskin in one place says we are unwise to build in any other style than that of the Pointed arch, "because it is the strongest in structure and a beautiful form, while the square head is both weak in structure and ugly in form."

The Egyptians and Greeks did not think this. They certainly knew of the arch. We have recently heard of the discovery of a brick arch in the tomb at Denderah erected 4,000 or 5,000 years ago, and yet the architects built their great monuments in the Trabeated style.

The fact is we are all inclined to worship the great achievements of the artists of the past, and to regard their work rather than the spirit and principles which underlay their work. Had our great Mediæval church builders been trammelled by precedent and style, how would their marvellous art achievements have been produced? We should never have had their masterpieces to glorify the land.

(*To be concluded.*)

TESSERÆ.

Chartres and Le Mans.

THE cathedrals of Chartres and Le Mans are about as unlike as any two great Mediæval churches well can be. Well nigh the only point of likeness is that each possesses a magnificent east end of the thirteenth century, of the usual French plan, with the apse, the surrounding chapels, the complicated system of flying buttresses. But at Chartres this east end is part of a whole. The crypt still witnesses to the days of Fulbert, the lower stages of the western towers to those of Adela and to those of John of Salisbury; but all the rest of the church, including of course all the interior, is of an uniform style and design. The church throughout follows the usual type of great French churches; the eye accustomed to the buildings of England or Normandy misses the central towers of Lincoln or of St. Ouen's, but Chartres is not in England or in Normandy, but in France, and its church is built accordingly. A fairer question of taste is raised by the unequal spires of the west front—a French feature again, but occasionally extending into Normandy and England, as at Rouen, Llandaff, Lynn and Canterbury as it was. But it is only in so long and varied a front as that of Rouen Cathedral that it is at all satisfactory. At Chartres the great south spire is modern and of iron, but we believe it very well reproduces the outline of the elder one of wood, and it certainly comes down heavily and awkwardly upon the towers and upon the roof of the church. The upper part of the north tower is frittered away with work of a later style. Still, allowing for the diversity of the towers, which of course does not appear inside, Chartres is a whole—a consistent, harmonious whole, of great, though we cannot think of first-rate excellence. How does such a whole stand as compared with a building of strange and, at first sight, unintelligible outline formed by the juxtaposition of two parts, each of admirable merit in itself, but which startle by their absolute contrast in every way? Chartres was made, Le Mans evidently grew; and different minds will be differently inclined in the comparison between a single harmonious work of art and a union of two buildings widely differing in date, style and proportion. But, on the other hand, it must be said that nothing at Chartres equals the parts of Le Mans taken separately, and that, in the inside at least, the incongruity of Le Mans is far from being felt in the unpleasant way that might have been looked for.

Reynolds's Influence on Portraiture.

Portrait-painting at the commencement of Sir Joshua's career was certainly in a very low condition. A general recipe for face-making with the greatest facility seemed to have been current throughout the country. Attitudes and looks were according to a pattern, and there was so great a family resemblance, however unconnected the sitters, that it might seem to have been intended to promote a brotherly and sisterly bond of union among all the descendants of Adam. Portrait-painting, which had in this country been so good, was in fact, with here and there an exception, and generally an exception not duly estimated, in a degraded state: the art in this respect, as in others, had become vulgarised. From this universal family-likeness recipe Reynolds came suddenly and at once successfully before the world with individual nature and variety of character, and portraits that had the merit of being pictures as well as portraits. He led to a complete revolution in this department, so that if he had rivals—and he certainly had one in Gainsborough—they were of his own making. The change is mostly perceptible in female portraits. They assumed grace and beauty. Our great-grandmothers were strangely vilified in their unpleasing likenesses. The somewhat loose satin evening dress, with the shepherdess's crook, was absurd enough, and no very great improvement upon the earlier taste of complimenting portraits with the personation of the heathen deities. The poetical pastoral, however, very soon descended to the real pastoral, and as if to make people what they were not was considered enough of the historical of portrait, even this took. Gainsborough probably was the first to sin in this degradation line, by no means the better one for being the furthest from the divinities. He had painted some rustic figures very admirably, and made such subjects a fashion, but why they should ever be so we could never understand, or why royalty should not be represented as royalty and gentry as gentry. Although Sir Joshua Reynolds generally introduced a new grace into his portraits, and mostly so without deviating from the character as he found it, dispensing indeed with the old affectation, we fear he cannot altogether be acquitted from the charge of deviating from the true propriety of portrait. Ladies as Miranda, as Hebe, and even as Thais, no very moral compliment, are examples—some there are of the lower pastoral. Mrs. Macklin and her daughter were represented at a spinning-wheel, and Miss Potts as a gleaner. There is one of somewhat higher pretensions, but equally a deviation from propriety, in his portraits of the Hon. Mistresses Townshend, Beresford and Gardiner. They are decorating the statue of Hymen; the grace of one figure is too theatrical, the others have but little.

Roman Work in France.

In France the interest and importance of Roman and of Mediæval remains are exactly the same in kind. Which is the higher in degree is a question which will be differently answered according to the respective tastes of different inquirers. Each alike is part of the continuous history of the country; no impassable gulf separates one from the other. Who can venture to say when the Roman style of building came to an end even in Northern Gaul? The masonry of many churches, down quite to the eleventh century, is still essentially Roman. No doubt a connoisseur in Roman art would despise it as very poor work when compared with work of the age of Augustus or even with work of the age of Constantine. But it is Roman work all the same; it is a style of masonry which had gone on in use without any break, without any one moment of change to divide one period from another in any marked way. In Gaul, in short, even in northern Gaul, "the Roman style" never actually died out till it merged in the latter style of the Middle Ages. So again in the South nothing is more curious than to mark, say in the great collection at Toulouse, the way in which the Roman sarcophagus gradually grew into the Mediæval tomb. There are all sorts of intermediate types, showing Roman forms of art—corrupted if anyone pleases, but still Roman and not anything else—going on after not only the Roman religion but the Roman dominion had died away.

Early Roman and British Roads.

The name of the first paviour, we fear, is unknown, unless we could identify him with Triptolemus, who was a great improver of Rhodes; but it is the fate of all the greatest benefactors of their kind to be neglected, and in time forgotten. The first regularly defined paths were probably footways—the first carriages broad-wheeled. No record remains of what materials were used for filling up the ruts; so it is likely in those simple times when Enclosure Acts were unknown that the cart was seldom taken in the same track. As houses were built, and something in the shape of streets began to be established, the access to them must have been more attended to. A mere smoothing of the inequalities of the surface over which the oxen had to be driven, that brought the grain home on the enormous plaustra of the husbandman, was the first idea of a street, whose very name is derived from stratum, levelled. As experience advanced steps would be taken to prevent the softness of the road from interrupting the draught. A narrow rim of stone, just wide enough to sustain the wheel, would, in all probability, be the next improvement; and only when the gentle operations of the farm were exchanged for war, and the charger had to be hurried to the fight, with all the equipments necessary for an army, great roads were laid open and covered with hard materials to sustain the wear and tear of men and animals. Roads were found to be no less necessary to retain a

conquest than to make it, and the first true proof of the greatness of Rome was found in the long lines of military ways by which she maintained her hold upon the provinces. We may be sure that no expense was spared in keeping the glorious street that led up her Triumphs to the Capitol in excellent repair. All the nations of the "Orbis Antiquus" ought to have trembled when they saw the beginning of the Appian road. It led to Britain and Persia, to Carthage and the White Sea. The Britons, however, in ancient days seem to have been about the stupidest and least enterprising of all the savages hitherto discovered. After an intercourse of four hundred years with the most polished people in the world, they continued so miserably benighted that they had not even acquired masonic knowledge enough to repair a wall. The rampart raised by their Roman protectors between them and the Picts and Scots became in some places dilapidated. The unfortunate natives had no idea how to mend the breach, and had to send once more for their auxiliaries. If such their state in regard to masonry, we cannot suppose that their skill in road-making was very great; and yet we are told that, even on Cæsar's invasion, the Britons careered about in war-chariots, which implies both good roads and some mechanical skill. We think it a little too much in historians to ask us to believe both these views of the condition of our predecessors in the tight little island; for it is quite clear that a people who had arrived at the art of coach-making could not be so very ignorant as not to know how to build a wall. If it were not for the letters of Cicero, we should not believe a syllable about the war-chariots that carried amazement into the hearts of the Romans, even in Kent or Surrey.

Standard of the Arts.

Art can never give the rules that make an art. This is probably the reason why artists in general, and poets principally, have been confined in so narrow a circle; they have been rather imitators of one another than of nature, and this with so faithful a uniformity and to so remote an antiquity that it is hard to say who gave the first model. Critics follow them, and therefore can do little as guides. We can judge but poorly of anything whilst we measure it by no other standard than itself. The true standard of the arts is in every man's power; and an easy observation of the most common sometimes, or the meanest things in nature, will give the truest lights, where the greatest sagacity and industry that slights such observation must leave us in the dark, or what is worse, amuse and mislead us by false lights. In an inquiry it is almost everything to be once in a right road.

A New Style of Architecture.

A mind educated in the knowledge of Italian and Gothic architecture, and afterwards admiring and teaching itself Norman and Romanesque art, must necessarily contain a strange medley of ideas, and find it most difficult in designing to free itself altogether from their influence; indeed, if actual originality is demanded in designing afresh, we had better not try, for into one of the established styles we must run. That one man should form an actual original style never has occurred, and probably never will occur; but he may lay the foundations for one, and in every alteration he makes from his model does so. If fancy and richness of design is needed, nothing can surpass Gothic and Moorish. The Florentine, Grecian and Palladian styles are severe enough for anything, but the intermediate style is wanting. Elizabethan is coarse and grotesque; Norman good, but rough and deficient in beauty. None of these can fix themselves into established styles; they are weighed and found wanting. No, nor can any style of the past be fitted entirely for the present, but they all fill up their allotted places in the museum of art, and as at the Natural History Museum we may see the gradual, nay imperceptible, change from a marmot to a lion, so in some future time will architecture stand as a complete system, of which each style forms only a separate link. Instead of Gothic architecture we shall have church architecture; instead of Italian, palatial; instead of Elizabethan, Grecian, Gothic, Egyptian, Romanesque, we shall have street architecture, railway architecture, bridge, shop, cottage and manufactory architecture.

Correspondence

Ketton Freestone.

Sir,—Our attention, as the solicitors of Lady Northwick, has been drawn to an article in your paper of the 2nd inst., page 16, in which you comment generally upon the alleged decay of the old Ketton freestone quarries, which belong to her ladyship, and observe that Major Braithwaite, an extensive landowner in Rutland, and whose property includes the village of Edith Weston, knowing that "the old Ketton quarries were about worked out," has opened quarries of his own in Edith Weston.

This is a *very gross misstatement indeed* as to the Ketton quarries, and the meagre explanation (if it can be called so) in your issue of the 9th inst. is an altogether insufficient way of meeting the matter. Not only are the Ketton quarries not worked out but they are in a most flourishing condition and producing more freestone than ever and of as good quality as ever, and only recently Mr. Thomas Caswell Molesworth has taken from Lady Northwick a mining lease for sixty years of 60 acres of ground in the centre of the parish of Ketton, the whole of which acreage, besides a very extensive area beyond, undoubtedly contains freestone of the same unexceptionable character as the quarries of Ketton have yielded for generations past. This lease has been expressly granted for the purpose of developing the Ketton freestone, and Mr. Molesworth has for some time past been engaged in laying down very costly machinery, in the fullest confidence that a greater development than ever will take place in this valuable stone.

It is a very grievous thing that such a statement as you inserted should be so recklessly made, and we have to call upon you to publish this letter, and not only so, but in common fairness to write an article in your next number, the 16th inst., contradicting your former statement, and expressing your regret for having inserted it.

It is hardly necessary to add that the publication of such a statement as you have made gives to our client and her tenants a legal right to substantial damages unless the method we have above proposed for counteracting its effect is complied with.—We are, yours faithfully, Curtler, Davis & Curtler.

Sansome Place, Worcester:
December 14, 1898.

[The statement we published came from a correspondent who has hitherto proved himself to be trustworthy. It was not the intention of the writer of the article, or of anyone associated with this Journal, to diminish the value of Ketton stone, or of the quarries from which the material was taken. The quality of the stone has been so well established for centuries that any attempt to affect the sale injuriously would be considered ridiculous by architects and builders. What was intended to be suggested, although it might not be as clearly expressed as is desirable, was that in case of any deficiency of supply of Ketton stone another excellent stone was obtainable in the district. In other words, the introduction of any reference to Ketton stone was intended to suggest quality, and not to discuss any question of quantity. All who have had experience in the use of Ketton stone, or have examined the old buildings in which it was used, will desire the quarries to be inexhaustible.—Ed]

GENERAL.

The City Lands Committee have obtained authority to retain the services as assessor of Professor Aitchison, R.A., at an honorarium of 400 guineas, in connection with the approaching competition in the designs for the rebuilding of the Sessions House, Old Bailey.

Mr. E. O. Sachs has installed the first section of the electrical stage appliances at Drury Lane Theatre. By its aid the finest terraces can be formed in a few seconds or the deepest caves arranged for underneath the stage by smply pressing a button. Whole scenes can be rapidly raisied or lowered, and transformations made with the greatest ease.

A Travelling Studentship of 50*l.* for the encouragement of the study of decoration is offered by the Painters' Company. It is open to competition by students between the ages of twenty and thirty-five in any recognised school of art or other institution devoted to the study of applied art in any form, and situate within the limit of the larger metropolitan postal area. Particulars may be obtained from the clerks, Painters' Hall, 9 Little Trinity Lane, E.C.

A Local Government Board inquiry was conducted at Herne Bay on Saturday on the application for a loan of 40,000*l.* required for the renewall of the sea-wall and parade there, which was so extensively damaged in the great gale in November of last year. The clerk to the Council, in the course of his evidence, said damage was at that time caused to the whole of the sea-front and the lower part of the town, some 200 houses being affected. The sea-front was temporarily repaired at a cost of 700*l.* It was explained by Mr. Baldwin Latham that the new sea-wall would be 1,924 yards long and 20 feet to 25 feet high, being so constructed that it would allow of the promenade being widened by 15 feet. Evidence in support of the scheme and in opposition having been heard, the inquiry was closed.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

Mr. E. V. Bailey, of Climax Works, Birmingham, informs us that he has purchased the old-established business of Messrs. Edwin Cotterill & Co., and that he will continue to manufacture the fire and burglar-proof safes, patent locks, cash and deed boxes, &c., for which that firm has a reputation of long standing. He has also acquired the business of Messrs. H. S. & F. L. Fear, manufacturers of door springs and every description of swing centres, which business, as many of our readers are aware, has been in existence upwards of sixty years. The businesses will be combined and carried on at the above address under conditions favourable alike to makers and consumers.

The workmen engaged in all but one of the different branches of the building trade in Birmingham made an application to the employers twelve months ago for an increase of wages. At the expiration of the six months' notice a halfpenny per hour was conceded, and the increase came into operation on April 1 last. The branch which did not participate in the increase was that of the bricklayers, but now they have applied for an advance, and it is considered probable that a concession of a halfpenny per hour will be made to them in April next.

BUILDING AND BUILDERS.

The contract for the work of rebuilding St. Peter's Church, Oldham, has been let. The estimated cost of the whole building is 12,000*l.*

Lord Roberts last week laid the foundation-stone of the Soldiers' Victoria Hall and Institute at Dover, about to be erected as a memorial of the Diamond Jubilee of the Queen.

At Thornaby on Friday the foundation-stone was laid of a new Primitive Methodist church and Sunday school in Peel Street. The new church will accommodate 450, and the cost is estimated at about 3,000*l.*

A portion of a sewer in course of construction at Stanningley, Leeds, subsided, and a workman named Coates was crushed to death. About 4 tons of earth fell upon him. A dozen other workmen had narrow escapes.

A site for a church-house at Liverpool has been purchased for 48,000*l.* The ground is at present occupied by offices at the corner of Lord Street and South John Street, known as Clarendon Buildings.

The design of Mr. Ness, Dundee, has been accepted for a public hall for Pitlochry. The total cost of the completed building, which will have accommodation for 600, is estimated at about 2,500*l.*

A handsome and commodious theatre is about to be erected at Finsbury Park. The plans, which are now before the County Council, include a spacious stage and an auditorium which will hold about 3,000 persons. Messrs. Murray & Foster, Adelphi, are the architects.

A scheme for the erection of a church for the large and growing population of South Retford and Ordsall has been set on foot, and a most eligible site has been secured. If the whole scheme cannot be carried out at first it is hoped that the nave of the permanent church, costing, say, 3,500*l.*, may be completed.

A pier is about to be erected at Fleetwood on the Fielden Esplanade, and immediately opposite Balmoral Terrace. The total length, including the jetty, is to be 1,300 feet, and upon it will be erected a handsome pavilion, with turrets and dome, rising some 60 feet. An extensive stage is to be built where first-class entertainments will be given.

The foundations are being prepared for a colossal hotel which is about to be erected at Buxton. The land, 8½ acres in extent, has been purchased from the Duke of Devonshire for

6,900*l.*, and the building alone will entail an outlay of 125,000*l.* It is to be thoroughly up-to-date in all particulars, to accommodate about 300 guests, and is to be completed by the year 1900. The architects are Messrs. Bodley & Garner, of London. From its position it will command magnificent views of the surrounding country.

A MEETING of Wesleyans was held in Darlington Street chapel, Wolverhampton, last week to consider a scheme to rebuild the edifice in a more modern style and provide further accommodation. It was explained that the chapel was originally erected in 1824, since which it had been enlarged and altered in many ways, and it was not sufficiently commodious for the 1,000 people who attended the Sunday evening services. The building required renovating, which would be very costly, and a scheme for rebuilding it at an estimated cost of 9,000*l.* was considered preferable. A resolution was adopted in favour of the scheme.

PRINCESS CHRISTIAN visited Brixton on Tuesday in order to lay the foundation-stone of the new church which is arising on the site of the old Christ Church, whose dilapidations rendered it unsafe for public worship. The new building, which is being erected from the plans of Mr. Beresford Pite, architect, will be reared on land adjoining the present church. It will be built in the Early Christian style, and is planned to seat 1,200 people without obstructions to sight or sound. A capacious west porch with a front cloister will face the Brixton Road. Part of the scheme of rebuilding was the erection of a parochial hall at the back of the church, and this has now been completed. The cost of the building is estimated at 12,000*l.*

AT the City Police Court, Coventry, on the 10th inst., Thomas Broughton, of Clarendon Street, Earlsdon, was summoned at the instance of the city engineer (Mr. J. E. Swindlehurst) for an offence against the Corporation's building by-laws. The town clerk (Mr. L. Beard) told the magistrates that the by-law was one of importance, but had to a considerable extent been disregarded for some time. It provided that each individual who erected a building should upon the completion thereof send a written notice of such completion to the engineer, and give him an opportunity of inspecting the building. The defendant put the defects pointed out to him right as soon as the legal requirements were pointed out to him. This was the first case taken under the by-law, and Mr. Beard did not press for a heavy penalty. Mr. Maddocks, for the defendant, said the latter's wife was the real owner of the property, and sold it before it was completed. Alderman Marriott said the by-law would be strictly enforced in the future. A fine of 5*s.* and costs was inflicted.

AT the monthly meeting of the Morecambe District Council on Monday a large number of plans for new buildings were submitted and approved, and as an evidence of the activity of the building trade in the town the plans committee had found it necessary to hold two meetings to dispose of the business before them. The plans of the Morecambe Pier Company for fore-bay and entrance to the pier were again before the committee. The sub-committee reported that they had met the directors, who had promised to consider the Council's proposals, but no reply had been received from them. It was resolved that the plans be not passed. A sub-committee was appointed to consider the question of obtaining a more regular boundary line for the eastern portion of the district, and if considered advisable, to confer with the Lancaster Corporation on the subject. The surveyor was instructed to prepare plans and sections of the structural works required in the making of thirty-three new streets.

THE Shrewsbury Town Council held a special meeting on Monday, when Alderman Herbert proposed that application be made to the Local Government Board for authority to borrow 3,500*l.*, for technical science and art instruction. He explained that the Horticultural Society had offered a site for the school at St. Julian's Friars, free of cost, and the managers of the School of Science and Art had offered to hand over to the proposed new school all their models and appliances in the existing schools. Mr. H. Farmer seconded the proposition. Mr. G. Evans condemned the proposed site as the most unsuitable in the town, and proposed another—The Priory—which could be purchased for 2,700*l.*, including the house, which could be made suitable for the school. Much discussion ensued, and the proposal of Alderman Herbert was finally adopted.

OWING to the large and growing increase of business in Arbroath Post Office the Department have found it necessary to provide more accommodation, and the erection of buildings in Hill Street, immediately opposite the present offices, is about to be commenced. The site of the new offices, adjoining the County Council Buildings, is 125 feet in length by an average of 46 feet in breadth. On the ground-floor there will be a large public office, 28 feet by 22, entering from a vestibule, and from this office will be entered the telegram delivery room and the

postmaster's room. Adjoining the public office, and communicating with it, the plans show a sorting office about 43 feet by 41, in connection with which are retiring-rooms for the postmen and sorting clerks, a store-room, barrow shed and lavatories. A yard which may be taken in at a future time if necessary separates the office from the County Council Buildings. The battery-room, 20 feet by 12, and a basket store complete the accommodation on the ground-floor. On the first floor the plans show the telegraph instrument-room, 40 feet by 22, entering from which are the telephone-room and a store-room. The offices are to be built of Grange stone dressings, with an elevation in Renaissance style, a conspicuous feature on which will be the Royal arms carved on a panel at the top of the main building. The plans have been prepared by Her Majesty's Board of Works, Edinburgh.

The plans for the new electricity station which is about to be erected at Coplawhill, Glasgow, comprise complete engine-house, boiler-house, coal stores and battery room, and also sundry offices, workshops, covered-in yard, and delivery yard and stores. The roof of the boiler-house is constructed of strong steel girders, supported by heavy cast-iron columns, designed for the purpose of carrying large open water tanks in which the condensers or cooling towers will afterwards be placed, and there are similar columns and girders for carrying the overhead coal tanks. Two chimneys, each 11 feet in diameter inside and 20 feet outside, and 200 feet in height, are included in the plans. The total cost of all the buildings, including engine foundations, boiler foundations and boiler settings for the whole plant which may ultimately be put into the station, and which will amount to about 15,000 horse-power, will probably be 49,051*l.*; but this estimate does not include the cast-iron tanks over the boiler-house, nor does it include a new line of railway siding which will require to be run from end to end of the buildings, nor certain hoists for coal trucks, sundry rails, coal tanks, and appliances for dealing with the fuel supply over the top of the coal stores. These accessories will in all probability cost a further sum of about 10,200*l.*, thus bringing the total for buildings and condensing and coal store facilities up to 59,251*l.*

The foundation-stone of the new Jenny Lind Infirmary, which is in course of erection in Norwich, from designs by Messrs. E. & E. T. Boardman, were laid on Tuesday last. The new building will consist of two wards, each forming a separate wing, in the centre of which will be the administrative block. The wards are planned so as to secure the maximum of fresh air and light, and will be very lofty. The completed building will be a handsome structure both in design and detail, and will form a great contrast with the antiquated premises so long occupied in Pottergate Street. The administrative block, which has been built up to the first floor, is of brick with stone dressings. The nurses' sitting-rooms and bedrooms will be on the upper floors. In the rear of this block will be the domestic offices, which will be ready to be roofed in a few days. At present only one of the wards. that on the western side, is being erected. This is in accordance with the expressed wish of Lord Leicester that nothing should be built for the maintenance of which there were not the necessary endowments. For the purpose of carrying out the plans of Mr. Boardman in their completeness, an additional sum of 5,000*l.* will have to be provided by the public; while another sum of 1,000*l.* is necessary for defraying the cost of furnishing and endowing that portion of the infirmary which it is contemplated to finish in the first instance.

ELECTRIC NOTES.

At the monthly meeting of the Morecambe District Council on Monday, tenders amounting to 4,480*l.* for additional electric-light plant were recommended for acceptance.

At a special meeting of the Shrewsbury Town Council, held at the Guildhall on the 12th inst., a letter was read from the Local Government Board sanctioning a loan of 30,463*l.* for the purchase of the undertaking of the Shropshire Electric Light Company and the extension of the works.

Colonel A. J. Hopper, R.E., recently held an inquiry at the Rochdale Town Hall, with respect to an application on the part of the Corporation to borrow 30,000*l.* for electric-lighting purposes. There was no opposition to the application.

Mr. Frederick Yorke, M.I.E.E., Glasgow, visited Blairgowrie last week, and with Mr. Lake Falconer, architect, examined various sources of power with a view to the introduction of electrical lighting into the town. Mr. Yorke was favourably impressed by the means available for the objects in view, and expressed his conviction of the practicable nature of the scheme. A syndicate is, it is said, being formed with a capital of from 8,000*l.* to 10,000*l*

MAJOR-GENERAL CROZIER, R.E., an inspector under the Local Government Board, held an inquiry last week, in the Council-chamber at the Birkenhead Town Hall, into an application by the Town Council for sanction to borrow 15,000*l.* for purposes of electric lighting. The town clerk explained that the money was required to provide machinery for increasing the generating power at the central electrical station, and also for providing new mains within the borough to meet the demand for the supply of electricity. Mr. Bates, engineer, gave evidence in detail of the proposed expenditure, and there was no opposition.

AN inquest was held at Southampton, on Tuesday, on the body of a man named Day, aged thirty, who was killed on Monday while laying electric mains for the Corporation. The deceased, who lived at 54 Wilford Road, Stoke Newington, London, was in the employ of the contractor, W. T. Glover, of Manchester. He was joining cables, and accidentally putting his hand on a fully-charged wire was instantly killed. The coroner said it would be necessary to adjourn the inquiry Men employed like the deceased should wear non-conducting gloves. The widow stated that the deceased's name was Davies, Day being only assumed. The inquiry was adjourned for a week.

THE new and very complete electric-lighting station which has been erected at Eccles, and was opened with ceremony on Wednesday evening, has been conceived and carried out with praiseworthy enterprise by the Corporation, and henceforth the streets of the town and many of the shops and places of business will be illuminated by electricity. A sum of something like 12,000*l.* has been spent upon the works in Cawdor Street, Patricroft, and the necessary plant. This latter consists of two Lancashire boilers, 28 feet long and 7 feet 6 inches broad, and two steam alternators, each of 200 horse-power, and each capable of supplying 4,800 eight candle-power lamps. The engines are of the marine inverted type, running at the rate of 2,000 revolutions per minute, and being directly coupled to the alternators. There are also provided accumulators, which will maintain 1,000 eight-candle-power lamps for seven hours. These accumulators are charged from the alternators by means of a motor generator, this latter, in its turn, being run by the accumulators, and supplying electricity direct to the mains. The system of distribution adopted is the high tension alternating current, at a pressure of 2,000 volts, which is reduced on the consumers' premises to 200 volts. This system has been selected owing to the exceedingly scattered nature of the district to be supplied. It is intended to carry out the whole of the public lighting of the borough, as already indicated, by means of electricity, and this will involve a supply of some 1,700 lamp columns. At the present moment there are about five miles of mains laid in the district, and applications have already been received for over 4,000 eight candle-power lamps. About thirty miles of streets will eventually be lighted. The work has been carried out by Mr. S. V. Clirehugh, M I.E E., of the firm of Messrs. Lacey, Clirehugh & Sellar.

THE annual general meeting of the Institution of Civil Engineers of Ireland was held on the 7th inst. in their meeting hall, 35 Dawson Street, Dublin, when the following were elected as officers and council for the year 1899:—President, W. W. Wilson; vice-presidents, Edward Glover and John Henry Ryan; council, William Anderson, Robert Cochrane, Louis E. H. Deane, Joseph H. Moore, William Purcell O'Neill, William Ross, Samuel J. Shannon and Prosser A. H. Shaw; hon. secretary, Marmaduke Backhouse.

THE new Mental Asylum at Lewisham, which has recently been erected by the Board of Guardians, is a handsome and commodious separate building, which has been erected on vacant ground formerly a part of the workhouse property, and consists of two wards, each measuring 29 feet 6 inches by 24 feet 4 inches. Each ward holds eight beds. There is an acute ward for special cases, together with padded rooms for both sexes. The lighting, ventilating, drainage and kitchen arrangements are of the latest and most approved kind. The formal opening of the building was performed last week. The cost was a trifle over 3,700*l.*

VARIETIES.

The Illinois Steel Company has decided to attempt the manufacture of cement from slag, of which large quantities have accumulated around the works.

Owing to the insanitary state of the Forest Gate schools, the Poplar Board of Guardians have at last decided to sell the site and to build new schools, possibly at Shenfield.

The work of erecting a handsome memorial to the late Right Hon. Edward Stanhope in the centre of the Market Place at Horncastle, Lincolnshire, is now complete. The cost of the memorial is nearly 400*l.*

The second members' meeting of the Liverpool Architectural Society will be held at the New Law Library, 41 Castle Street, on Monday next, the 19th inst., when a paper will be read by Mr. Talbot Kelly on "Saracenic Architecture," with limelight illustrations.

Steps are being taken for an immediate resumption of the restoration of the great west front of Peterborough Cathedral. The south-west angle is to be treated in the same manner as the north-west so far as restoration may be found to be necessary.

At a meeting of the Scarborough Town Council it was stated authoritatively that the new marine drive and sea wall, which the Corporation are constructing round the Castle Hill at a cost of some 80,000*l.*, will not be completed before the summer of 1900, a year beyond the original time.

The Painters' Company offer a travelling studentship of 50*l.* for the encouragement of the study of decoration. It is open to competition by students between the ages of twenty and thirty-five in any recognised school of art or other institution devoted to the study of applied art in any form within the limit of the larger metropolitan postal area.

An extraordinary accident occurred at Southend on the 10th inst., whereby the pier was cut in two. A small pleasure yacht, the *Dolphin*, in a strong wind dragged its anchor and was driven broadside on to the structure, which was completely severed and damage done to the extent of nearly 2,000*l.*

The new premises of the Govan section of the Glasgow United Young Men and Women's Christian Association were opened on Saturday afternoon. The building, which is a four-storey one, has a frontage to Water Row on the east side and Manse Lane on the north side. On the first floor are a library, a reading-room, the secretary's room and several ante-rooms, while on the second and third storeys are a number of class-rooms and several large halls. A gymnasium, measuring 34 feet by 27 feet, occupies the whole of the fourth flat. The cost, including the purchase of the site and furnishing, amounts to about 7,500*l.*

The magnificent block of buildings for the Higher Grade Schools which has been in course of erection for the past twelve months in connection with St. George's Church, Hanover Square, has now been completed, and was opened on Tuesday last by the Duke of Cambridge. The schools are erected partly on the site of the old schools and partly on a piece of land given by the Duke of Westminster, and they form a very imposing feature of South Street, where they are situated. Their cost has been about 17,000*l.*

A considerable part of the fishing harbour at Auchmithie, near Arbroath, was destroyed by the gales a few weeks ago, and at the annual meeting of the Auchmithie Harbour Trust it has been resolved to apply to the Scottish Fishery Board for a grant towards the repair of the harbour. Auchmithie Harbour was built a few years ago to take the place of the natural harbour and beach which had for centuries been used by the fishermen. Three-fourths of the cost was provided by a grant by the Fishery Board and the remainder was raised locally.

The Metropolitan Tribunal of Appeal had before them on Wednesday a matter under the London Building Act involving the question of the extent of the County Council's authority over the construction of corner houses in the laying out of streets. Mr. Seaman, the appellant, secured in 1886 the sanction of the Board of Works to a contract by which he became the builder of houses, &c., upon freehold property in Mozart Street, Paddington, and under it he now proposed to erect a building at the corner of Mozart Street and Bravington Street. The London County Council, however, decided that under the Act the two frontages of the house must be uniform with the respective streets to which they were adjacent. The view of the builder, however, was that corner houses should be treated as having a frontage in only one of the streets. The Tribunal decided that the house would have to be regarded as being in both streets, and the decision of the London County Council and their superintending architect was upheld.

Magdalene Church, Belfast, an extensive building situated in a densely populated district, has been entirely destroyed by fire. The fire brigade was quickly on the scene, but despite their efforts the church was burned to the ground.

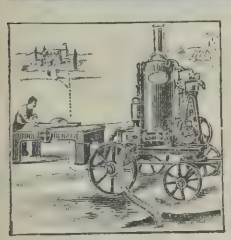
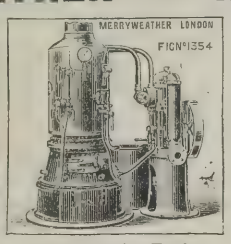
ON the 3rd inst. the Bishop of Coventry dedicated the new church mission room at The Cotteridge. The erection of the room forms part of the scheme of church extension in King's Norton parish, details of which were recently given in these columns, when the memorial-stone of a new church at Stirchley was laid. This work has become necessary in consequence of the rapid increase in the population of the parish, and will cost altogether rather more than 10,000*l.* The Cotteridge portion of the extension will cost 2,500*l.* It is a substantial building, but already it is seen that it will not afford sufficient accommodation for the rapidly-growing district.



A TERRIBLE accident occurred on the Goole Canal at Sykehouse on Friday evening, whereby Mr. Wigan, the resident engineer at the new canal which is being cut between the Goole Canal and the Sheffield Canal, and a man named Robert Cawson, lost their lives. It appears Mr. Wigan and some men were standing on a platform on some piles at the dam made at the junction of the new cutting, when, it is believed, a plank gave way, and the crane was precipitated into the water, carrying Mr. Wigan and Cawson, the crane-driver, with it. Another man named Masters was badly injured. Word was conveyed to Aire & Calder's offices at Goole, and Mr. Barling, chief engineer, immediately left with Dr. Blair for the scene of the disaster. At the time of telegraphing neither body had been recovered, and it is feared they are both under the crane. Mr. Wigan was formerly on the engineering staff of the Leeds and Liverpool Canal.



AS a preliminary to filling in with mosaic work one of the three vacant spaces in the central hall at St. Stephen's, the panel over the entrance to the corridor leading to the Commons lobby has just been opened up for the reception of Sir Edward Poynter's cartoon of St. David. This will immediately face the presentment of St. George, by the same artist, which was erected some years ago, and the brilliant colouring of which is always a source of admiration when the hall is lighted. It is expected that by the time Parliament reassembles in February next the work will have been completed, leaving only the panels to the right and left, in which are to be placed the late Mr. Albert Moore's designs of St. Andrew and St. Patrick, to be filled in.

THE inaugural concert took place on the 7th inst. of the handsome suite of public halls which has been presented to the burgh of Pollokshaws by Sir John Sterling-Maxwell of Pollok, M.P. The new hall is built on a very convenient site at the corner of Barrhead Road and Bengal Street, the style of architecture being a phase of the Renaissance. The principal entrance is from Barrhead Road, the door being under the clock tower. Immediately on the right there is a spacious vestibule and a corridor with cloak-rooms and other recesses in front. The large hall, which has a gallery and balconies, accommodates about 800 people, the small hall, which also has a gallery, accommodating about 200 people. There are various ante-rooms, &c., kitchens and janitor's house. The total cost may be roughly estimated at between 16,000*l.* and 20,000*l.*, and, in addition, Sir John has intimated his intention of making an annual gift of 100*l.* to insure that there shall be no deficit.

A THOROUGHLY comfortable and well-appointed home for the nurses attached to the Leeds General Infirmary was opened on Monday. The structure is of three storeys, with basement, and has frontages to Thoresby Street and Sunny Bank Street. At the junction of what may be termed the two wings is the entrance porch. The architecture is of the Domestic character; there is little of a decorative nature in the exterior, but pleasing effect has been obtained by the general grouping and proportion. The material is red brick relieved with stone dressings from the Morley quarries. Accommodation is provided in the new Home for fifty-two nurses, each having a separate room. Their comfort in other ways has been studied. On the ground floor of the east wing, with a southern aspect, are two day-rooms—one for the sisters and the other for the nurses—and also a writing-room. On the north side is the recreation-room, 30 feet by 25 feet, and not far off is a small visitors'-room and a small kitchen for the preparation of light refreshments, the ordinary meals being taken in the hospital. In the courtyard at the back is a bicycle shed, with stalls for thirty-two machines, for many of the nurses participate in the popular recreation. Everything within the home is, like the exterior, plain, neat and substantial. The rooms and corridors are well lighted by day, and at night illuminated with the electric light. The heating is effected by low-pressure hot-water piping and radiators. Ventilation has received careful attention. All the bedrooms are cross-ventilated by means of air-inlets in the outer walls, with valves under control, and hinged fanlights over the doors opening upon the corridors. Fresh, warmed air is also introduced. In the principal day-rooms the vitiated air is extracted by automatic ventilators and extraction flues. All the sanitary fittings are of glazed ware. The architect of the building is Mr. W. H. Thorp, and the erection has been carried out under his supervision.

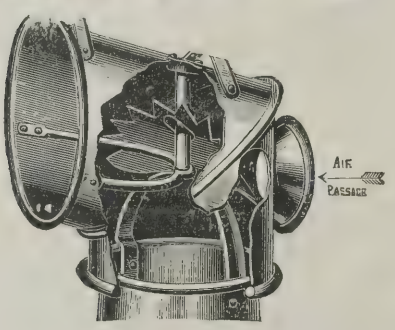
TRADE NOTE.

THE new Infectious Diseases Hospital, Burnley, for the Burnley Joint Hospital Board is nearing completion; it is being erected from the designs and under the supervision of Mr. F. S. Button, M.Inst.C.E., Burnley. The whole of the wards are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues, Manchester grates, exhaust roof-ventilators and special inlet panels.

VENTILATION OF THE HOUSES OF PARLIAMENT.



IN a paper on the "Ventilation of Tunnels and Buildings," which was discussed on Tuesday at the Institution of Civil Engineers, Mr. Francis Fox referred to the ventilation of the Houses of Parliament. These buildings, he pointed out, were erected in 1836 by the late Sir Charles Barry, and, considering that they were designed for the requirements of sixty years ago, it was not surprising that they were unsuited to the necessities of the close of the nineteenth century. For the work which then had to be transacted the committee-rooms were doubtless of ample capacity, and the ventilation arrangements were evidently the subject of much thought and consideration; but, unfortunately, they had not been extended concurrently with the growth of public and private business in Parliament. The vitiated air was extracted by furnaces in the roof, the fresh air being filtered through cotton wool, cooled or warmed as required, and pumped into the chambers by fans and machinery. But this having been done, much of the good was undone, the air being admitted through open matting on the floors on which were wiped the feet of people coming from the muddy or dusty streets of Westminster. Need it be wondered at that occasionally there were epidemics of influenza and other maladies among honourable members of Parliament? In addition to this grave state of affairs, the quantity of air admitted was wholly insufficient, the condition of the lobbies, the division lobbies and the committee-rooms being most objectionable and dangerous. Cases of blood-poisoning had come under his notice, and on behalf of the counsel, Parliamentary agents, solicitors, engineers and other witnesses occupied in the committee-rooms, he would appeal to the authorities to ameliorate the condition of affairs. It might be difficult and costly completely to remodel the Houses of Parliament, but there was no difficulty in providing at once silent, quick-running electric fans in connection with every room. This would extract the vitiated air, and the fresh air could be admitted in proper situations—certainly not through the floor. This ought to be done before the ensuing session, for the present condition of affairs prevented the business of Parliament and Parliamentary committees from being properly carried on.

THE BRITISH NON-FLAMMABLE WOOD COMPANY, LIMITED.

THIS company is to be congratulated on the success which it has achieved in the short time it has been established. We have availed ourselves of more than one occasion to direct attention to the fire-resisting qualities of the wood treated by the company's patent process, and are pleased to see that the chairman (Mr. E. Marshall Fox) was able at the second ordinary meeting of the company, which took place at the Westminster Palace Hotel, to speak of the substantial progress of the company and its roseate future prospects. Mr. Marshall Fox pointed out that it had been considered advisable to establish a commercial working plant in this country to treat the wood and to supply it, demonstrating either the goodness or the badness of the product. Works have been erected at Fulham, and the cost of the buildings, plant and machinery amount to 25,899*l*. The works occupy some 3½ acres of land, and consist of huge cylinders, tanks, locomotive engines, &c., for carrying on the business on a very large scale. Without disparaging the works in America, which had been in operation for three years supplying the Government of the United States, he thought he was right in saying that the company's works were the most complete, the best equipped and capable of a greater turn-out of the product. It is not alone for building purposes that the company desire to apply their wood, but to cause it to be adopted in the building of ships. Mr. Marshall Fox stated that it was brought before the British Admiralty about eighteen months ago, and they had made very extreme tests of it at Chatham and elsewhere. The result of all these tests that the British Government had made was that they had given

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards, Basements, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above uses. Gold, Silver and Bronze Medals awarded, Brussels International Exhibition, 1897, for Hygienic Street and Stable Pavement. Highest Award at the Agricultural Hall for Kennel Paving, 1897 and 1898. Samples, Prices, and all particulars of THE IMPROVED CORK PAVEMENT CO., LIMITED, 21 ST. MARY AXE, LONDON, E.C.
TELEPHONE, NO. 2705 AVENUE. TELEGRAPHIC ADDRESS, "QUIETISM, LONDON."

Soho Cowl & Ventilator
(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.
The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.
"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."
"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."
"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

the company orders, about two months ago, for the woodwork of the new Royal yacht representing about 300,000 feet. He was happy to be able to state that two consignments of that had already been inspected and passed by the Admiralty surveyor. The first consignment had been sent to Pembroke and was being worked up for the Royal yacht, and had given the most complete satisfaction. Following on that, within the last few weeks the Admiralty had specified non-flammable wood for four new battleships, two new cruisers and twelve torpedo-boat destroyers which were about to be laid down. The company had the full specifications before them from the shipbuilder, but it was not possible to make any definite statement as to the amount of woodwork that would be required; but he might safely say that it would occupy their works at Fulham, large as they were, day and night for more than a year. Further, it was stated that H.M. Board of Works have ordered the wood to be used in an addition which is being made to the British Museum.

THE CORONET THEATRE.

THE summonses against Mr. Edward George Saunders, manager of the new Coronet Theatre, at Notting Hill Gate, for keeping the building open without a license, have been heard at the West London Police Court. Mr. Avory described the case as a flagrant violation of the law, and he was instructed, in the event of it being proved, to ask the magistrate to inflict the full penalty on each summons. A letter was received on November 8 from the defendant stating that the theatre would be opened on the 28th, but on an inspection in the morning the building was found incomplete and unfit for the reception of the public. It was also found that there had been a serious deviation from the plans, as the width of the passages and doors had been reduced. In spite of the warning the theatre was opened, and was still being kept open. The excuse was that the house was booked to be opened, and the manager was faced by a large crowd who might have wrecked it. Defendant chose the evil of opening the house rather than lose money which was coming in. If he had given notice to the public there would not have been a crowd nor any fear of a riot. Mr. Avory said that he wished it to be understood that there was a clear intention to enforce compliance with the law, and that persons attending the theatre were liable to be arrested by the police.

Mr. Rose-Innes suggested that the magistrate should view the theatre, as the defects looked well on paper, but did not exist in fact.

Mr. Rose did not accede to the suggestion, remarking that he could judge a play but not a building

The architect of the Council was examined as to his report, and in answer to a question said there was danger in one passage leading from the dress circle. At one point it was 3 feet 9 inches wide instead of 4 feet 6 inches, allowing only two persons to pass abreast instead of three. It had not more panic doors than any other theatre. The building opened into three streets, and had a splendid frontage.

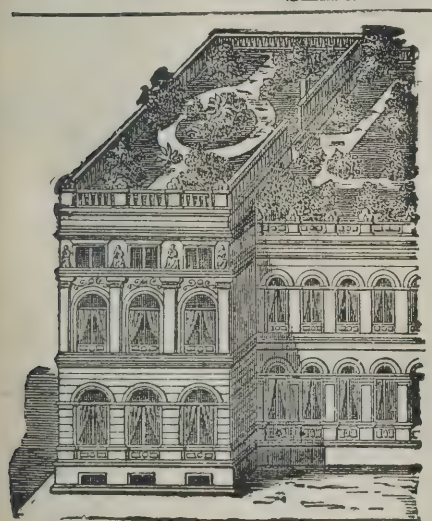
Mr. Rose-Innes: It has admirable exits for the public?

The witness: It has exits according to the regulations of the County Council.

Further evidence went to show that attempts were made to comply with the regulations, but that they were not complete on the 7th inst. when the assistant visited the theatre. The officials had not heard of any accident through the opening of the theatre.

Mr. Rose-Innes applied for an adjournment for time to consider the evidence and to call witnesses.

Mr. Rose directed the attention of counsel to the fact that the defendant had not a license in one case nor a certificate in the other.



Mr. Rose-Innes admitted that the defendant was technically wrong, but he was placed at the time on the horns of a dilemma. He said that there was not any danger in opening the theatre.

Mr. Sprague, the architect who prepared the plans, said that the regulations were now complied with, and they were practically completed on the opening night. The exits were excellent, and equal to those of any other theatre.

The defendant said that he was the managing director of the theatre, and had had considerable experience. He attended the Council when the license was refused. He returned, and found a crowd. Every seat in the house was booked. Having determined to open the theatre, he provided extra firemen, and there was perfect safety. Every part was well lighted. All the requirements were now absolutely completed. He had been put to heavy expense to satisfy the Council. He never told the committee that they must go for penalties. Up to the last moment he acted under the advice of Mr. Sprague, who led him to believe that a license would be granted.

Mr. Rose-Innes having addressed the magistrate in mitiga-

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

tion of the penalties, the magistrate said that the defendant had opened the theatre in deliberate violation of the law. He saw nothing to lead him to reduce the penalty, and imposed a fine of 20*l.* for each night, amounting to 160*l.* With regard to the certificate regulating the means of escape from fire, he took into consideration that there was no danger, and imposed a penalty of 10*l.* for each night, amounting to 70*l.* In all 230*l.*, with 10 guineas costs.

Mr. Rose-Innes gave formal notice of appeal.

LONDON COUNTY COUNCIL WORKS DEPARTMENT.

The finance committee of the London County Council have prepared the half-yearly statement of works executed by the Works Department up to September 30, 1898. There are some large and serious losses again revealed, although it is noticeable that the most important losses have occurred in connection with works commenced when the works committee was in existence, and before the present manager of works, Mr. Adams, was appointed.

With reference to estimated engineering and architectural works the statement is divided into two portions, one dealing with the works begun under the late management and the other with those begun under the new régime, brought about as the result of the inquiry of the special committee on the Works Department. In the first division four works are reported upon, the final estimate for which was 78,708*l.*, whilst the actual cost has been 103,429*l.*, revealing a loss of 24,721*l.* when the cost is balanced against the estimates. The most serious loss has been incurred in the construction of the Lewisham sewer. This work was undertaken by the department in May 1895, on an estimate from the engineer of 54,092*l.* The actual cost of construction has been 77,016*l.*, showing an excess of cost over estimate of no less than 22,924*l.* The manager of works in his report upon the reason for this large excess explains the difficulties which cropped up during the execution of the work. He mentions that, although the work was accepted by the department in 1895, it was not completed until April 1898, and that during that period increases in the rates of labour and material took place, seriously affecting the cost of the work, which in the first place had been undertaken at prices which did not allow of any margin. He understands that during the construction of the first portion the river Ravensbourne broke into the works two or three times, causing serious damage and requiring heavy expense in pumping and repairs. From what has been explained and from his own observation when he took the work over on his appointment in February 1897 it would appear that there had been serious neglect or incompetence in the carrying on of the work by those immediately in charge, and this was borne out by the fact that the late manager had to make changes in the staff, and the acting manager, during the interim, had to make further changes, and in taking the work over he had also found it necessary to do the same. These he puts down as the principal reasons for the excess in cost over estimate before his appointment, which amounted to 19,722*l.* Since his appointment there has been a further excess of cost over estimate of 3,201*l.*, and of this he thinks 1,000*l.* may be set down to the period of the reorganisation of the work and rearrangement of the staff, whilst the remainder is practically accounted for by the extraordinary charges for establishment during the year 1897-98, which, owing to the small amount of work entrusted to the department, rose from 8 per cent. to 16½ per cent., or an addition to the cost of 1,991*l.* In their report recommending the Council to sanction the payment of the excess cost in regard to the Lewisham sewer, the main drainage committee submit a statement of all works executed by the department for the committee, exclusive of the Lewisham sewer. This return shows that on eighteen works estimated to cost 101,354*l.* there has been a saving of 3,264*l.*, whilst on a large number of jobbing works there has been a saving of 2,943*l.*

On each of the other three works commenced under the late management, and now reported upon, there has been a loss. On the erection of dwellings for the housing committee on the Green Street and Gun Street, Southwark, site, estimated to cost 18,279*l.*, there has been an excess of 1,467*l.*; on the construction of the approaches to the Vauxhall temporary bridge, estimated to cost 3,940*l.*, an excess of 263*l.*, and on the construction of the foundations and basement to the Battersea river fire station an excess cost of 64*l.* In regard to estimated works commenced during the present management—that is, since February 1897—there are eight included in the statement. On these there is a balance of cost below estimate, or a saving of 3,720*l.* Losses are shown on five of the works amounting in all to 729*l.*, but these losses are counterbalanced by savings amounting in the aggregate to 4,449*l.* The largest saving is

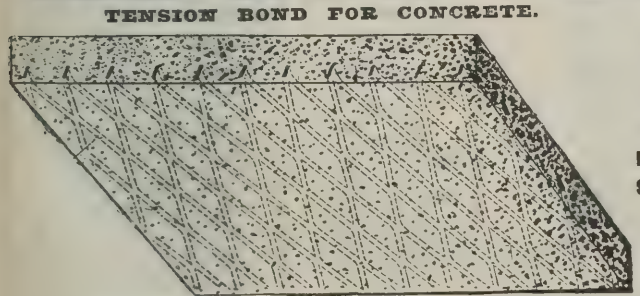
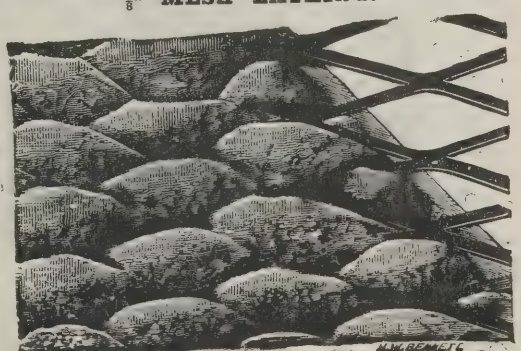
shown on the construction of sewers and roads in connection with the Millbank Estate. The estimate for this work was 9,326*l.*, whilst it has been executed for 4,494*l.*, showing the large saving of 4,376*l.*, of which 1,179*l.* is due to payments from persons desiring to shoot earth and hard core upon the site. The largest loss is shown in connection with some paving works in the Blackstock Road, Islington. This work was estimated to cost 2,801*l.*, and actually cost 3,373*l.*, or an excess of 572*l.* The manager explains the excess to be due to the unfavourable position of the site, being 4 or 5 miles from the wharf, and the large cost of cartage. The whole of the twelve works included in the statement show the following result:—Estimate, 92,909*l.*; actual cost, 113,909*l.*, or a total balance of cost above estimate of 21,000*l.*

A further statement showing the totals with reference to all the estimated works carried out by the department since its creation in 1892 reveals the fact that upon the operations of the department in regard to this class of work there has been a total loss of 50,239*l.* All of this was incurred during the late management. Under the present management there has been a total saving of 9,373*l.*, so that the balance of loss, all of which is attributable to the late management, is 40,866*l.* On jobbing works executed by the department under a schedule of prices since 1895 there has been a saving on the schedule value of 6,185*l.*

In their report accompanying these statements the finance committee draw special attention to a feature of the returns which, they think, shows in a clear light the necessity for keeping the department sufficiently employed, because, whilst the annual amount of general expenses varied but little from year to year, the percentage to cover such expenses must vary with the amount of work done by the department in the year. The first four works reported upon were carrying a charge for general expenses working out at about 9½ per cent. of the total cost. That charge included interest on and the repayment of capital. The committee were not satisfied that this charge was as low as it ought to be, for in the case of the last seven works reported upon the general charges represented no less than 15 per cent. of the total. The amount of work executed by the department during 1897-98 was 173,739*l.*, and that for 1898-99 was estimated at 240,000*l.* For the next two years the work in sight, together with that which might be reasonably expected, would probably be sufficient, but the committee were considering the possibility of regulating in some way the volume of work to be kept in hand.





A REMARKABLE BUILDING SCHEME.

THERE is building in Newhall Street, says the *Birmingham Post*, an edifice which its originator hopes will play an important part in social and economic progress. The name of the founder will give a clue to his object. It was with Mr. W. T. Smedley, the leader for many years of the Hospital Saturday movement, that the building and the scheme of which it forms part began. Hospital Saturday will be an important partner, perhaps for some time the predominant one, in the scheme, but many more things are in view, and greater things seem to be foreshadowed. Like Hospital Saturday the scheme is meant to be self-supporting, while its promoters do not disdain the friendly shove-off which Hospital Saturday, in some of its enterprises, has received and has followed up to such good account. To this end the building has been shrewdly plotted out. The promoters have taken on a ninety-years' lease, from the Colmore trustees, a corner site with a frontage of a hundred feet to Newhall Street, and one of 265 feet to the street sometime known as Bread Street—a street with a past—which having been extended to Newhall Street has now become reputable under the name of Cornwall Street. The rear of the site is bounded by New Market Street.

In Newhall Street the scheme will exhibit its commercial aspect. All the rooms on this (the more valuable) side will be to let, and thus the enterprise is expected to pay its way. This part of the Colmore estate is rapidly improving. Its professional and commercial occupants are increasing yearly in number, and Newhall Street is the recognised home of the consulting physicians. Doctors' chambers therefore and suites of offices will occupy the Newhall Street front. Architecturally dissociated from this part of the scheme by a bank at the corner, the industrial, social or philanthropic section presents its front more modestly, yet in no way abjectly, to Cornwall Street. The whole site measures 3,010 square yards. By taking a large area, including a good deal of back land, the promoters have secured sufficient for their purpose at a very low rate for the locality, namely, at an average of about 3*s.* per square yard.

From the Newhall Street level the building will rise to the height of four storeys, the attic storey in the front being continued as a mansard in Cornwall Street. The material will be red brick, plentifully enriched with bands, mouldings and arches of buff terra-cotta. Having in view the use to which the Newhall Street side will be put, the architecture there will

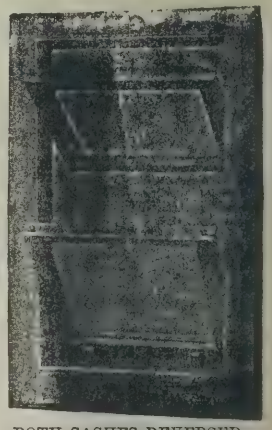
be almost domestic in its character. The design has been adopted by the architects (Messrs. Essex, Nicol & Goodman) from that of an Elizabethan mansion. The frontage will be ornate but not florid, the details well-balanced, and the general effect, in the materials selected, cheerful but dignified. The front, recessed from the street line so as to give room for a palisaded area, will be broken at each end by projecting sections crowned by gables of curved outline. Each of the two middle sections will have a series of bay windows carried up to the third floor and topped with an ornamental parapet, while the Elizabethan gables will be higher and of bolder character. The high-pitched roofs of the gables in front and the mansard roof at the side will be of grey-green slates. At the corner an octagonal turret will be carried up to the full height of the gables. The middle entrance leading to the public hall, which forms an important part of the scheme, will be a projecting porch with a boldly-moulded arch and pediment. A smaller entrance of similar design will be provided for the officers' staircase, and in the base of the turret will be a large arched door for the bank, the adjoining window of which in Newhall Street will be similarly treated. The Cornwall Street side of the front block will be in similar style to the Newhall Street frontage, but the façade will not be broken. On the ground-floor seven large round-headed windows will light the bank offices, and the upper two storeys will have square two-light windows, while the windows of the mansard storey will be of similar contour to the front gables, and will be joined by a handsomely-decorated parapet.

The Workmen's Hall block, with its subsidiary buildings, will extend to New Market Street. Its architecture will be in harmony with the rest, and the material will be the same, but a little greater freedom and picturesqueness of treatment will help to give it due prominence. The middle bay will have two high-pitched gables and a partly-timbered roof. This will be flanked by two bold projecting bays containing the principal entrances, and each surmounted by an ornamental parapet and a turret, while two projecting bays will connect the block with the bank section. This rear block will have four storeys. The ground floor, corresponding with the basement of the front portion, but given a greater height by the drop in the level of the street, will be laid out partly as a club. It will have a smoke-room (35¼ feet by 62¼ feet), a dining-room (44½ feet square), a games-room (35 feet by 31¼ feet), with a porter's-room, a servery a bar and other conveniences, and committee-rooms for the institutions using the building. The rooms above will serve as offices, for the institutions using the building. The bank will have a spacious public office, with ample private accommodation in the way of rooms for managers and clerks, &c. The doctors' rooms, entered by their own doors from Newhall Street, will be on either side of the main entrance, three suites being provided on the ground floor and four on the first floor. Twelve suites of offices will be included in the lettable space of the front block. The public hall will form an important part of the scheme. It will hold from 1,700 to 2,000 persons, and thus will supply the want that has long been felt of an assembly-room not so difficult to fill as the town hall, but larger than those at present in use. It will be available for such purposes as public meetings, balls, bazaars, concerts and theatrical entertainments. There will be a well-equipped stage, 80 feet by 28 feet, with green-rooms, dressing-rooms, scene-dock and every theatrical appurtenance, and a sunk enclosure for the orchestra. The auditorium will measure 90 feet by 64 feet, with a height to the centre of the elliptical ceiling of 48 feet and to the wall-plate of 36 feet. On three sides will be a gallery rising to the top of the room, and having eleven tiers at the end and five at the sides. Access to the gallery will be given by corridors running round the hall at different levels. The hall, which will be handsomely decorated, will be divided into bays, with circular heads cutting into the elliptical roof, and forming a coffered ceiling. The stage will be structurally isolated from the auditorium, and will have an iron curtain, while there will be an ample number of exits from the hall. The principal entrance will be by the large doorway in Newhall Street, and having a long and wide corridor. Adjoining the hall there will be large rooms available for meetings, or for supper-rooms and drawing-rooms; while catering for parties has not been overlooked in the plans. The entrance corridor, about 134 feet long, should solve the waiting-at-the-door difficulty as far as this building is concerned.



Many uses suggest themselves for the accommodation provided in this building. Hospital Saturday of course will have its headquarters here, and so will gain another such element of permanence as it received from the establishment of the convalescent homes, with the additional advantage that it will be constantly before the eyes of the men, women and children of Birmingham. The "Home Clubs"—formed by ex-patients of the convalescent homes—will have their natural abiding-place here, and their aid, now so great, to the progress of the movement will be turned to even better account. It is hoped that trade societies and other workmen's organisations,

friendly and co-operative societies, and other aids to self-help, and philanthropic organisations conducted by the working classes, will make the place their home. The clubrooms should afford excellent and social educational advantages. It is suggested that they should be open to members of all the societies using the building. The bank at the corner standing half-way between the commercialism of Newhall Street and the philanthropy of Cornwall Street, still has its future hanging in the balance. Let to an insurance company it would add largely to the return on the investment; used as a workman's savings bank it might work something of a social revolution. There is nothing in Birmingham like the Yorkshire Penny Savings Bank, which, with its numerous branches, has been such a practical and powerful preacher of thrift. Mr. Smedley hints at something even greater. A savings bank with a branch in every factory could collect, even on the present Hospital Saturday basis, and with the same number of contributors, 25,000*l.* a year. This represents a capital of 800,000*l.* Supposing the money were bound to remain at compound interest for twenty years, the accumulation would be enormous. As for the investment of this capital, Mr. Smedley's motto for the workman in a small way, who may have to follow his work from one part of the town to another, or from the town altogether, is not "Buy your own house," but "Buy your own houses." The money, in fact, could be placed in the safest of all investments—real property, and especially cottage property—with the advantage that the men being, though only in a collective sense, their own landlords, would think of health and comfort as well as profit. This is but one of many things which may come out of the Workmen's Hall in Cornwall Street. What the scheme at present amounts to is this:—A company has been formed with a capital of 40,000*l.*, the dividend on which is limited to 4 per cent. in any one year. The company has power under its articles of association to undertake any financial, commercial, trading, or other operations as may be thought desirable for its commercial success. It may undertake, found, subscribe to, or otherwise aid any enterprise likely to be beneficial to the working classes, either directly or indirectly. The establishment of a workman's bank is one of the things specially referred to. The capital of the company represents the estimated capital outlay on the scheme. Taken as a whole the enterprise is supposed to represent a good 6 per cent investment. The letting of the Newhall Street block is relied upon to pay the stipulated 4 per cent., while the letting for workmen's purposes, which will be at low rents, will furnish a fund which may be used for the redemption of the capital, in order that the building may in the end become public property. The amount as yet subscribed is 23,000*l.* This is sufficient to justify proceeding with the building, the walls of which are already above the ground. Whether the rest will have to be raised by mortgage or not depends upon the favour which the scheme finds among those in a position to help it forward. The principal shareholders at present are Mr. Richard Cadbury (chairman of the company), Mr. W. Pilkington, Mr. A. Pilkington, Sir John C. Holder, Mr. A. M. Chance, Mr. J. H. Wilkinson, Councillor Murray, Mr. A. B. Holingsworth, the contractor for the building (Mr. J. Bowen), the architects, and Mr. Smedley.

EDINBURGH AND LEITH MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Edinburgh and Leith Master Builders' Association was held in the Royal British Hotel, Edinburgh, last week, and was attended by over 120 gentlemen. Mr. John Lownie occupied the chair, and in welcoming the delegates who were present from Glasgow, Perth, Dundee and Aberdeen, said the building trade all over the country was in an exceptionally busy condition; in fact, the time they lived in was very aptly described in a very old book as a time of pulling down and a time of building up. The toast of "The Queen and the Royal Family" having been honoured, the Chairman proposed "The Magistrates and Council of Edinburgh and Leith," remarking that our municipal representatives deserved well of us. Councillor Douglas acknowledged the toast. He could assure them the members of the Corporation appreciated the kindly remarks made by such associations as that. Some thought they were a very extravagant Corporation. There was something to be said for that, because they had entered of late years into very large schemes, but the Corporation felt that through time they would be a great benefit to the citizens generally. He mentioned such schemes as the widening of the North Bridge and the reconstruction of North Bridge Street. As in the tramways they had, no doubt, the charge laid that they had been very long in pushing forward the work and getting it finished, and had the original ideas been carried out the tramways would have been running ere this; but such a demand was made on the members of the Council for extensions throughout Edin-

burgh that they felt bound to give way, and the consequence had been that they were not really completed yet with their cable system. When, however, it was completed it would be a paying concern, and would be very advantageous to the citizens generally, and when electricity came to be the motor power of the country they would be able to lay it down quite easily. Councillor Fisher, Leith, also acknowledged the toast. Mr. Rex submitted the toast of "The Edinburgh and Leith Master Builders' Association." Mr. William Forrest, replying, said their Association was started about eighteen or nineteen years ago with a membership of something like sixty, composed wholly of masons. They had now a membership of over 170, and they had amalgamated with them joiners and plumbers, and he hoped they would press forward towards having all connected with the building trades united into one. "The representatives and members of kindred associations" was proposed by Mr. Drysdale, and replied to by Mr. Forbes, Mr. M'Ewan and Bailie Selkirk (Glasgow), ex-Bailie M'Leish (Perth), Mr. James Worling (Aberdeen) and Mr. James Buirie (Dundee). Mr. Drysdale proposed "The architects and surveyors," which was acknowledged by Mr. Hunter Crawford, who referred to the loss the profession had recently sustained in the death of Mr. Hamilton Beattie; and by Mr. Carfrae and Mr. Lawrence. "Our merchants and contractors" was proposed by Mr. Elliot, and responded to by Councillor Graham Yool (Leith). Other toasts followed.

SANITARY SCIENCE.

THE questions set by the examiners in practical sanitary science for the candidates at the Sanitary Institute on December 2 and 3 were as follows:—

1. What is the law relating to the diffusion of gases? What bearing has this on the ventilation of living rooms?

2. Describe the wet and dry bulb thermometers. State how the relative humidity of the atmosphere can be arrived at by means of this instrument.

3. What is meant by "ground air" and "ground water"? What circumstances affect the movements of each, and how may they get polluted?

4. Specify the construction and materials of a fireproof floor 60 feet long and 20 feet wide, capable of bearing a distributed weight of 25 tons.

5. How can a schoolroom best be ventilated? What should be the size of inlets and outlets provided, and what should be the relative positions of these openings?

6. Describe briefly a refuse-destructor and its uses. What temperature is usually maintained to destroy ordinary town refuse, and what percentage of clinker remains after cremation?

7. In what state of combination does the largest proportion of nitrogen exist in fresh town sewage? Shortly describe the treatment you would recommend for defecating the sewage and utilising the nitrogen compounds in solution.

8. A drain with a fall of 1 in 40 has a velocity of flow of 3 feet per second; what velocity would be secured if the same drain is relaid with a fall of 1 in 30?

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

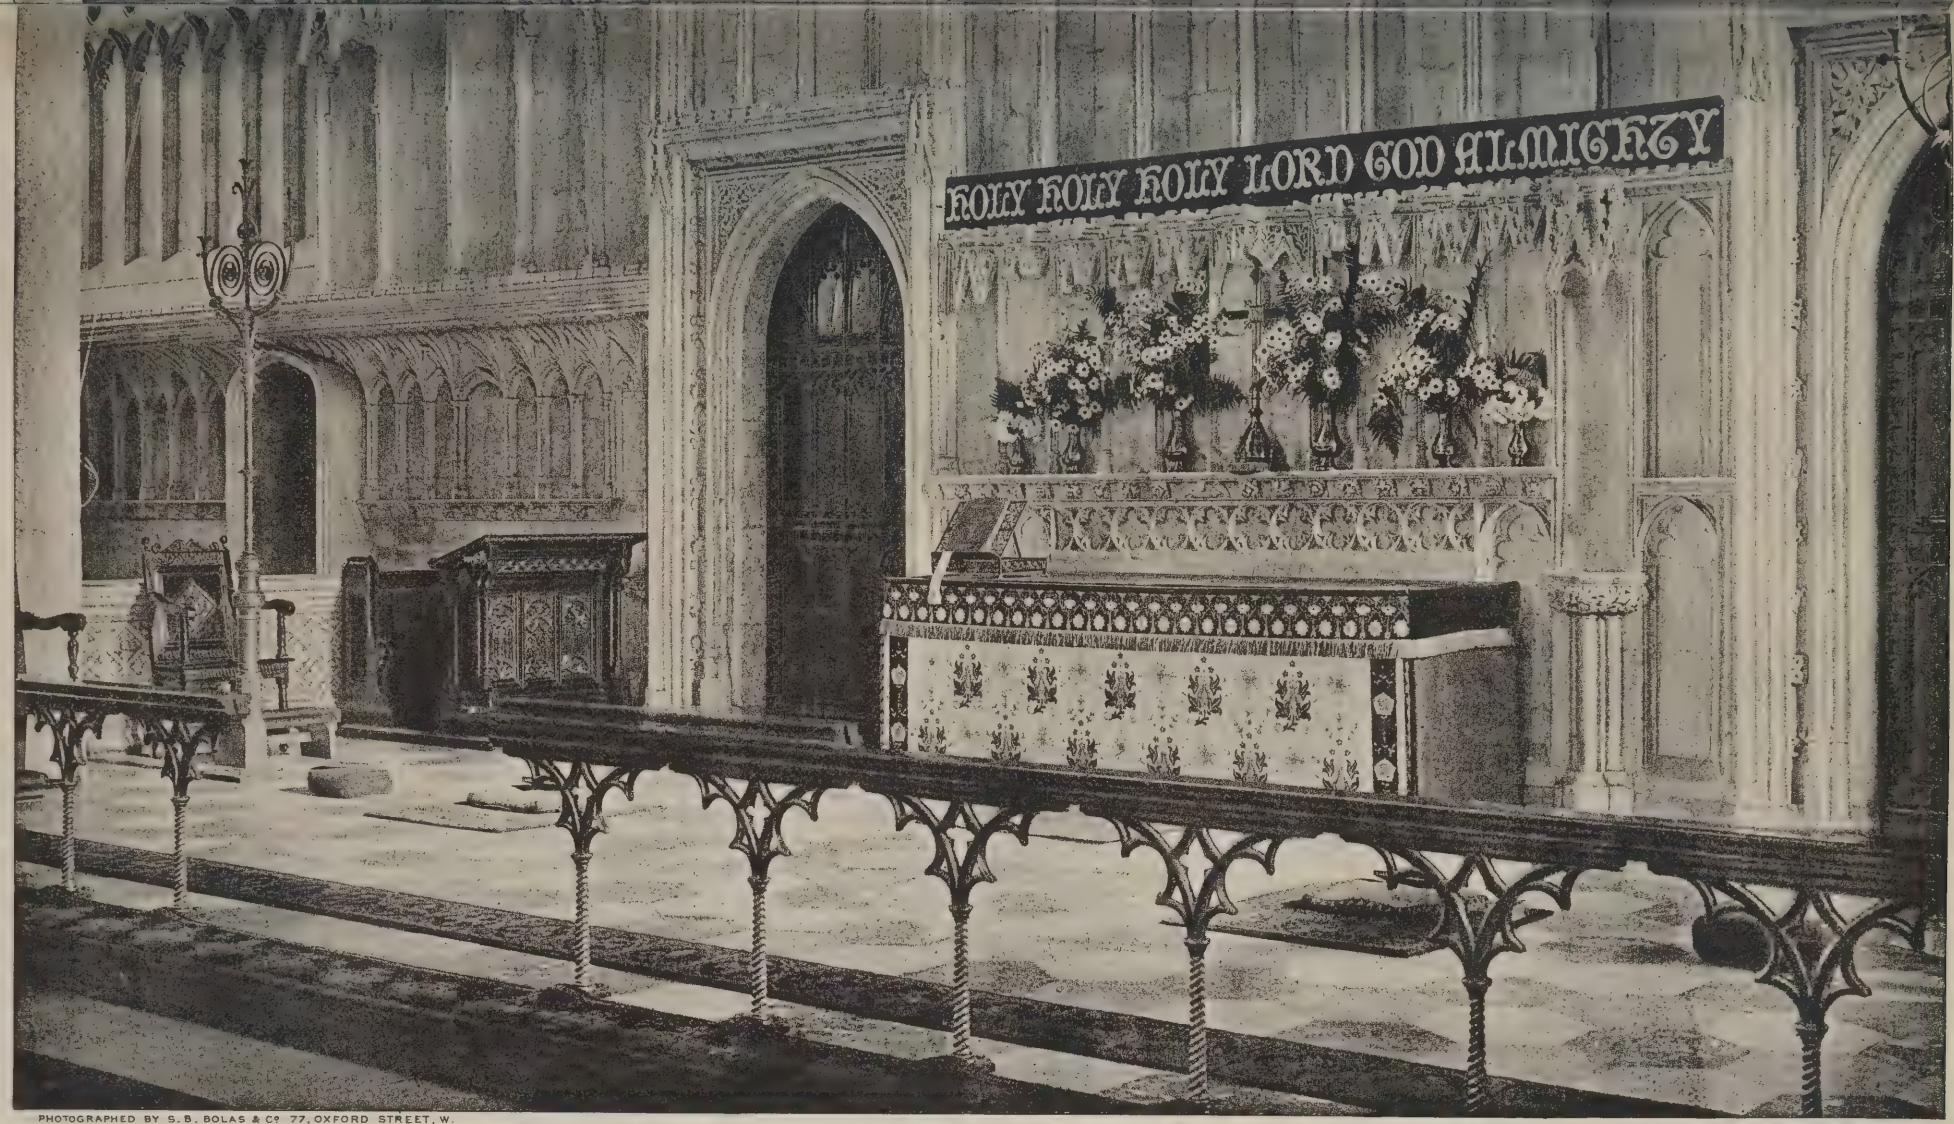
25155. Thomas William James, for "Improvements in the manufacture of artificial marble, granite and the like."

25252. Edward Henry Carlyon, for "Improvements in puzzle-bricks for instructing children."

25304. Reginald Haddan, for "Improvements in the process of manufacturing artificial stones."

25360. Charles Marson, for "An improved artificial stone for buildings and the like."

Specifications Published.



9263. Cummings & Cooley, for "Stone sawing machines."

18231. Bachmann Vogt, Weiner Konig Kirchner and Jorg, for "Electrical appliances formed of artificial stone."

THE WEEK.

A CURIOUS case (FINCH *v.* WOODROW) of contractor's liability was heard in the Court of Appeal on Saturday. The plaintiff, who owned a public-house in Bishopsgate Street Within, agreed with the defendant, a builder, to carry out alterations, the most important being the construction of a fireproof flooring over the refreshment bar. It was agreed that business was not to be interrupted during the works. One day a part of the ceiling fell on three customers in the bar. The accident was caused by a workman stepping on a steel joist before it was fastened, when it tilted and caused some of the plaster to fall. The customers threatened actions against the plaintiff, but the defendant said that he assumed responsibility, as he was insured for his own workmen and the public. A trial action was brought, and judgment was given for 50*l.* with 29*l.* 6*s.* 8*d.* costs. The money was paid by the insurance company and handed over to the plaintiff. The two other customers then claimed damages, and the plaintiff paid money into court. The insurance company, however, refused to pay any more damages on the ground that it was a mistake to have paid the first sum. The plaintiff consequently brought an action against the defendant. The jury found that the accident was caused by defendant's workmen, but the judge considered that the plaintiff was not liable to his customers, and therefore could not sue defendant upon his agreement to indemnify. Lord Justice SMITH considered that the defendant did not carry out his contract, since the business was interrupted and three customers were injured. The customers who brought the actions could not be non-suited, and therefore the defendant was bound by his promise to indemnify the plaintiff. Lord Justice RIGBY concurred on similar grounds. Lord Justice COLLINS said the defendant ought to have taken reasonable precautions for the protection of those who were in the bar. Under the circumstances the plaintiff was therefore entitled to recover. Apparently, the builder, as is not unusual, took too much for granted. The agreement with the insurance company is likely to have been misunderstood, and as the contract with the plaintiff was not in writing it is no wonder it was indefinite. The builder's notion was that the liability between himself and the plaintiff was mutual.

MR. THOMAS DREW, R.H.A., has for the third time been elected as president of the Royal Institute of Architects of Ireland. There could not be a more significant testimony to his efforts to obtain adequate recognition for the profession of architecture in Ireland. The Institute has now central offices in Lincoln Place for meetings and for the use of members, with whom may be included the members of allied societies visiting Dublin. The ancient name of the thoroughfare was "Patrickswell Lane, leading by Slicer's Lane to the pleasure-ground known as the Folly, in the suburbs of Dublin at Lazy Hill." One of Mr. DREW'S suggestions was the appointment of a standing art committee, which was adopted after his address. There is much need of a censor in Dublin. Works of at least two English architects are in danger. Trinity College, of which Sir WILLIAM CHAMBERS was architect, is to be degraded by an enlargement which is suggestive of artisans' dwellings. The City Hall, which was originally the Royal Exchange—a building designed by THOMAS COOLEY—is surmounted by a dome. It is contemplated to transform the central space beneath into offices for the municipal officers. Sky-signs are becoming common and advertisement hoardings appear to be more profitable than the houses they enshroud. There is much else which offends the eyes of visitors, and for their sake, if the natives are indifferent, we hope the Institute's interference will be accepted in goodwill.

THE late Baron FERDINAND DE ROTHSCHILD, who died suddenly on Saturday last, was not much known as a patron of modern British art. But he possessed one of the storehouses from which the organisers of Winter Exhibitions of the Royal Academy could draw attractive works. Many amateurs were looking forward to the time when the pictures he was able to buy from the SIX Collection in Amsterdam last year would be seen in Burlington House. It was remarkable that although he prized many of the Dutch masters, he was indifferent to REMBRANDT. The Baron's examples of portraits by REYNOLDS, GAINSBOROUGH and ROMNEY were among the best existing. But of late he preferred works of early painters, and the one picture which he confessed to covet was VAN EYCK'S *John Arnolfini and his Wife* in the National Gallery. In his country house, Waddesdon Manor, which was designed by a French architect in the style of Chambord, there was a marvellous collection of French workmanship of various descriptions. It is to be hoped several of the objects will find their way to the National collection. Unlike many wealthy people, Baron FERDINAND did not buy with the intention of displaying his wealth by forming a museum of costly things. He sought after whatever gave pleasure to himself, and he was a gentleman whose taste was cultivated. On that account Waddesdon Manor is a treasure house with far more unity than is commonly seen when there is unlimited wealth to buy curious, beautiful and historic objects.

IT is generally satisfactory to Englishmen, and especially at the present juncture, when they find Frenchmen flattering them by imitation. For the sake of our neighbours we must wish they had not thought it would be advantageous to have a Workmen's Compensation Act. The measure has not yet passed the Senate, but coming events cast their shadows before. One victim has been sacrificed to the immature Moloch. In Paris the builders are busy, and consequently there is an unusual demand for stone-workers. But a few days ago one of the trade threw himself out of a window of his dwelling in the Rue des Amandiers and was killed. Why did he commit suicide? Simply because he could not obtain employment. He was married and was the father of six children. Under the new law that is fatal to a workman. The indemnities are so large that employers will not engage men who will leave claimants to set up a legal demand for compensation in cases of accidents. If he were a bachelor he could have earned at least eight francs a day, including Sundays, but as the father of a family he was doomed to starvation and suicide.

BREAD-CRUMBS are supposed to be more useful than indiarubber in cleaning plans. But the most experienced surveyor could not have anticipated that a use for them would be discovered in the cleaning of frescoes, although bread is employed to freshen wall-papers. Professor CHURCH, who is devoting much attention to MACLISE'S pictures of WELLINGTON at Waterloo and NELSON at Trafalgar, proposes to apply a shower of bread-crumbs to the wall-paintings. Chemical washes appear to be dangerous, and it is not unlikely that the gentle friction of particles of baked flour would be more effective. At all events, there is not much risk in the experiment.

THE Bradford City Council recently sought for competitive designs for a central Fire Brigade station. As the conditions were considered to be unfair, the Bradford Society of Architects and Surveyors offered various suggestions for the amendment of them. For instance, it was originally stated, "That if the works be carried out under the supervision of one or more of the competitors whose designs have obtained the premium, then the said premium or premiums shall be merged into and become part of the architect's commission," from which it might be concluded that the works could be divided among some competitors. Owing to the remonstrance of the Society that condition has been abandoned. Originally there was no guarantee that an assessor would be called on. It is now said that if the Council determine to do so the nomination shall be left to the President of the Institute of Architects. Originally the 5 per cent. commission was to include payment for quantities. Now there is an addition of 1½ per cent. to meet that expense. The time for sending in designs has been extended from January 2 to February 1, 1899. A margin of 10 per cent. over the 10,000*l.* proposed to be expended will be allowed.

CHRISTMAS: A REVERIE.

[BY A CORRESPONDENT.]

AT Christmas I consider the houses I have designed in a peculiar, or, let us say, in a seasonable light. During the rest of the year if I think of them it is as structures or as property. I see them not as they appear to outsiders, but with their internal arrangements manifested. I dare not say they are perfect even in my eyes. I am glad when I find the houses are occupied, for every architect must desire to see his clients rewarded for the investments in which he was the agent. A vacant house may mean the break up of a family, and in such cases there is no hope of reparation, for it is vain to ask—

> Ah! when shall they all meet again,
> As in the days long since gone by?

The only answer is the French preacher's "Toujours! jamais! Jamais! toujours!" A house to let may, however, signify inconvenience or sundry discomforts, and that is not an agreeable discovery for an architect; or it may be evidence of a decline in the value of a neighbourhood, which he may imagine he should have foreseen. For these reasons and others, consideration of the houses that we have planned does not always afford unmixed joy.

At Christmas time it is possible to think of them as homes, and by that one word how much is conveyed? Sir HENRY WOTTON described the English home as "the theater of a man's hospitality, the seate of self-fruition, the comfortablest part of his own life, the noblest of his son's inheritance, a kind of private princedome, nay, to the possessors thereof, an epitome of the whole world." But much more could be said concerning the treasure which the home can yield, and it is never more productive than at the close of the year. "Is it not plain," asks EMERSON, "that not in senates, or courts, or chambers of commerce, but in the dwelling-house must the true character and hope of the time be consulted?" It is as the scene of events which have more than individual interest that I endeavour to contemplate the houses in which I claim an abstract or imaginary ownership. Although I know all about the roofs, as I have no ASMODEUS to help me I cannot remove them. I must therefore trust to fancy to see relatives and friends gathered in the rooms and rejoicing in a hospitality which blesses those who give more than those who receive, and to see reconciliations sealed, hope inspired, pity bestowed on some. The arrangement of the rooms as I think assumes an interest which I am afraid I did not anticipate when I laboured over the drawings, and I claim to have had a share in the light and warmth which enhance the heartiness of the hosts. That young and old rejoice I take as partly an effect of my work, and any pains I may have taken are rewarded.

If put under examination I must, of course, admit that all my visionary pictures are delusions. My acquaintances who profess to have discovered the realities of life are confident that Christmas, with its aids and appurtenances, are the most melancholy of all things. There is no sincerity, it is said, in the ostentatious overflowing of spirits, no more real joy in the gatherings at houses than is found among the assemblies of "supers" in the pantomimes. In both the effects are "got up" for the occasion, and the stage management of the theatre is supposed to be exhibited on a diminished scale in private houses. Poor houses, in which all parts were so simple and truthful when they left the architects' hands! All this cynicism is no more true than the rejoicing it would dispel. It is only one of the signs of—

> The hardening of the heart, that brings
> Irreverence for the dreams of youth,

and age as well as youth can have its consoling dreams. Whatever we come across is pleasing or the reverse according to the valuation we make of it, and Christmas festivities can become a source of pleasure to onlookers as well as participators. The wise Vicar of Wakefield said that nature had made him find as much delight in happy human faces as other men discovered in the colours of a tulip or a butterfly, and we suppose he did not exhaust the pleasure. It is true, Christmas dinners are not always feasts of reason and flows of soul, and DICKENS's description of one under the most favourable conditions may not be comparable with any of the Banquets of the Learned of which ATHENÆUS was the reporter. But when contrasting the two, it is well to take into account the difference of the races.

To a Greek a bowl of wassail, a boar's head, a turkey, a sirloin of a prize ox, plum pudding, mince pies and the like would appear to be the elements of a feast that was adapted for barbarians alone. On ordinary days a Greek could subsist on a few olives, with bread and cheese. When he was invited to a banquet he expected to fare on dishes that to English appetites would be ridiculous if not repulsive. Readers of "Peregrine Pickle" will remember the attempt to revive ancient elegance in eating, and how Mr. PALLET, the painter, on tasting the soup, "seemed to be deprived of all sense and motion, and sat like the leaden statue of some river-god, with the liquor flowing out at both sides of his mouth," and how, when he recovered, he expressed a preference for burning brimstone. After tasting one or two of the dishes the honest artist declared he would not give one slice of the roast beef of Old England for all the dainties of a Roman emperor's table. At last, however, the smell of some of the stuffing was so intolerable to him that in his hurry to escape he brought down the table and scalded the guests. Critics who object to English dinners will find a lesson in SMOLLETT's novel, in which the real effects are suggested of dishes which in an antiquarian essay may only excite surprise. There was much else beside the dishes which made an ancient banquet dangerous.

The English Christmas festivities were always those of men who were healthy in mind and body. They originated with the Northern sea rover who—

> High on the beach his galleys drew
> And feasted all his pirate crew
> Then in his low and pine-built hall
> Where shields and axes deck'd the wall.

The unrestrained spirit which inspired those early carousings prevailed for many a century, and it was excusable if once a year the burthen of life was lightened, although there was not much refinement in word or action. As SCOTT wrote:—

> England was merry England, when
> Old Christmas brought his sports again.
> 'Twas Christmas broach'd the mightiest ale;
> 'Twas Christmas told the merriest tale;
> A Christmas gambol oft could cheer
> The poor man's heart through half the year.

Impressions are less enduring in our time, and I doubt if a model pauper could be made happy for three months or three weeks by the recollection of an exceptional Christmas dinner, while the majority of hosts know too well that their guests' memories vanish in a more brief time. Only the feasts which disagree with us are likely to be remembered.

But whatever the effects, we can always best judge of a people by their dinners. Instinct is a better guide than fashion in the choice of food and drink. What best agrees with Englishmen can be grown or reared in England. All FITZSTEPHEN of Canterbury said in the twelfth century remains true, namely, that there is no need to seek in Asia or Africa for delicacies when there were always available "roast, fried and boiled viands, large and small fish, coarser meat for the poor, with venison, fowls and small birds for the rich, without going beyond the country." A great many of the importations which are in use may be pleasant, but they are injurious.

Although I have been led almost mechanically to write about Christmas fare when thinking of houses, the subject was not in my thoughts when I allowed myself to fall into a reverie. I am not an epicure, although I know many artists who pride themselves on their inventive skill in cookery. I believe, however, that the meals of a people are as trustworthy a clue to character as any other we can discover. In England they never corresponded with those of countries which are denominated Classic. The difference may be due to custom, or may be caused by physical qualities in the people. Whatever the origin, there is no doubt of its existence.

In literature we have had a similar experience. Although for hundreds of years the Universities have endeavoured to acclimatise Greek and Latin in this country, they have not prevailed. It cannot be said that one scholar has succeeded in employing either language in a work of sufficient length to compel acknowledgment of his power by foreign critics. Nor can the imitations of Classic works in English be considered as equal to similar attempts by Frenchmen. Nor can it be said that the ablest English sculptors have caught the Greek spirit. The public are not, however, dissatisfied, for what interest can gods and goddesses have for them? In architecture, and in it alone, the necessity of keeping close to Greek and Latin models became so imperative that slavish copying was the result. The national spirit was in reality as indifferent to Greek or to Roman buildings as to Greek or Roman dishes, but influences were brought to bear which made it indispensable that the ancient models should be reproduced with fidelity. When one sees the examples of the Classic period which for a time passed over England, one wonders how Christmas festivities could have been held with such chilling surroundings. At present a Classic hotel is dreary enough to the eye of travellers. What must have been "a home," however stately, which was treated in the same fashion? Was there ever a sincere regret expressed when the style was superseded? We may at least be certain that nobody who was once at a Christmas party in a mansion which was described as Classic would care to renew acquaintance with it.

Yet there are comfortable houses at the present day which show a relationship to that style. It is, however, Classic which has suffered a sea change on reaching us. An ancient would say the style had lost refinement and the qualities which used to give it character. I am afraid there is a perversity among us which makes light of deviations from a sublime original. When CHAPMAN'S "Homer" appeared there were men of exquisite taste in England, and they appreciated the free treatment of the Greek poet's work beyond any literal rendering of his lines, because, much as they loved fidelity, they loved inventiveness still more. Nor was there an outcry when, in "Troilus and Cressida," the Trojans were described as more deserving of success than the Greeks. Thought was always free in England, and who could prevent the men of SHAKESPEARE'S time from believing that HECTOR was a braver soldier than ACHILLES or that DIOMEDE was inferior to TROILUS? To a purist the play is an extravaganza, an unworthy travesty of the noblest of poems, but even in matters of taste the English mind submits to dictation with difficulty.

My reverie has already gone far enough, and it is time to recover before arriving at depths which would be perilous. What I would assert is that at a time like the present there is something to monopolise the thoughts of an architect who for twelve months has been toiling in a prosaic manner in his art. The chance of a brief period of liberty cannot be seized. But if the thoughts must run upon architectural subjects there is no necessity to fix them on quantities, estimates, tenders, extras and similar subjects which do not always afford relaxation. I have allowed my fancy to roam as it liked, and in the end I do not think less of the style of building which appears in outline on my drawing-board, although I must own it would not please an architect of Athens or Rome.

THE MYSTERY OF MICHEL ANGELO'S POEMS.

IT is commonly assumed that when LORENZO THE MAGNIFICENT invited MICHEL ANGELO, then a lad of fifteen and an apprentice to a painter, to become an inmate of his palace in Florence he was displaying surprising condescension. In one sense the act could be so interpreted. But it should be remembered that, although the young artist's father LODOVICO was so mercenary as to insist on payment as if the affair were a slave-dealing transaction, yet the BUONAROTTI were of a higher lineage than the MEDICI. The latter belonged to a family of druggists, and came from Magelli, a village at the foot of the Apennines. MICHEL ANGELO on his father's side was, as VASARI tells us, descended from the most noble and most ancient family of the Counts of CANOSSA, and his mother was also of noble birth. The Florentines, whether nobles or plebeians, were fond of lucre, and his contemporaries may have considered the ex-Podesteria was only acting wisely when he turned LORENZO'S admiration for the young MICHEL'S abilities into a source of revenue. But a genealogist would say the prince did not have to stoop much when he received the pupil of GHIRLANDAJO into his house in 1490. Nor was it as a menial the youth received five ducats monthly, and a violet-coloured mantle occasionally.

LORENZO had promised to treat the lad as if he were one of his own sons. Three of them were then living—PIERO, who succeeded his father and was allowed to rule for a couple of years; GIOVANNI, afterwards known as LEO X.; and GIULIANO, who at his death was a French duke as well as a Florentine prince. There were also four daughters, of whom the youngest was LUIGIA. MICHEL ANGELO was welcomed among them as if he belonged to their family. He sat at table with them, and shared with them the instruction of POLITIAN and other masters. At the meetings of the Platonic Academy, which were among LORENZO'S relaxations, he was able to meet with LEON BATTISTA ALBERTI, PICO DELLA MIRANDOLA and other glories of the Renaissance. An impressionable youth like MICHEL ANGELO was able to inhale knowledge almost without labour. They were happy days, although occasionally envy disturbed them, as in the case of the unfortunate TORRIGIANO. But they lasted only four years. The MAGNIFICENT died, and as VASARI says, "MICHEL ANGELO returned to his father's house in great sorrow for his loss;" and well he might, for whatever were his political faults LORENZO was generous to young BUONAROTTI. CONDIVI says that MICHEL ANGELO suffered so much that for several days he was unable to work, a circumstance that, more than words, reveals the state of the artist's mind.

Can we suppose that the younger MEDICI were all proof against the fascinations of the youthful genius? Was Platonism dominant in the household? The portraits we have of MICHEL ANGELO suggest a stern, if not morose man, and it is easy to conclude that his character had never changed, and that he was never much of a ROMEO. Before he received the blow from TORRIGIANO he was a handsome as well as a vigorous youth, and there was no reason to prevent him from submitting to love's influence like the majority of Italians of his own age. LANDOR, in a "Conversation" between VITTORIA COLONNA and MICHEL ANGELO, makes the lady say, "Before we go into another state of existence a thousand things occur to detach us imperceptibly from this. To some (who knows to how many?) the images of early love return with an inviting yet a saddening glance, and the breast that was laid out for the sepulchre bleeds afresh." We can imagine such words were really spoken, for LANDOR'S sentences would not be unworthy of issuing from the lips of a COLONNA; but, if so, would they excite no train of recollections in the mind of MICHEL ANGELO? Much as he may have admired VITTORIA in his old days, we cannot consider she was his first love. Was all MICHEL ANGELO'S admiration for beauty while he was an inmate of LORENZO'S house restricted to the "valuable antiques and excellent pictures" which were to be found in the gardens and galleries? If that were true of him, then PIERO MEDICI was justified in employing him throughout a whole winter in making statues of snow.

The sculptor was not a man to "wear his heart upon his sleeve for daws to peck at," and although he was all ready to break out in the presence of a pope or a prince, he never gave many opportunities to spies or tale-bearers. But a man of his genius must at times have had thoughts which required to be uttered by different means besides marble or fresco. So great an admirer of DANTE could not despise poetry as if, like painting in oils, it were an occupation adapted for women alone, and a commentator who could occupy twenty-four pages with a dissertation on a sonnet of PETRARCH did not need WORDSWORTH'S advice, 'Scorn not the sonnet.' A collection of MICHEL ANGELO'S sonnets and madrigals appeared in 1623, having been edited by his grand-nephew from manuscripts which are in the Vatican. The poems were not entirely a surprise, for some of them were printed during the lifetime of the artist. That many of them were inspired by the mature VITTORIA COLONNA is more than probable, for although

another hand may have written her name upon them, yet the peculiar ideal character of the sentiments and the reverential admiration expressed, as if the writer were addressing a beatified personage, tend to that conclusion. But in the collection there are others which are not entirely etherealised. Can we suppose they are compositions of his youthful days, when, as Vasari records, he gave proof of boldness and animation in all he did? According to the same authority, at the time of Michel's birth the constellation Venus exhibited a friendly aspect, and why should not Luigia de' Medici come under the celestial influence?

If a name were mentioned in one of the sonnets or madrigals, the theorist's task would be simplified. Poets, however, appear to consider that nomenclature belongs to prose alone. Besides, in that age and in Italy it would be treason to aspire to the consideration of a princess. Tasso came to grief for introducing "Eleonora mia" in a verse which he kept from publication. Michel Angelo possessed qualities which foretold renown, but a princess, although of a commercial family, was a princess, and for an artist to hope for her hand was as foolish as to love "a bright particular star and think to wed it." Anyone who is eager to solve the mystery contained in the artist's poems must therefore make the experiment for himself. There are the lines: are they addressed to an elderly or a young lady, are they inspired by the idolatry of youth or by the reflection of age? Moreover, some of them may have another aim. Dante's "Beatrice" appears at times to be an impersonation of virtues and sciences, and Michel Angelo may have often indited some of his sonnets to his art. The whole series is almost as much of a puzzle as those of Shakespeare, but we are never disposed to desire after reading them that they were never written. However obscure, they reveal the beauty of Michel Angelo's mind.

Thackeray was mortally offended when Edmund Yates referred to his flattened nose, which was caused by a blow at school from young Overend. We can then understand how the effect of Torrigiano's stroke would cause agony to a handsome young artist when he found his face was transformed. Now the twenty-first madrigal reveals suffering of that kind. Michel Angelo wished to represent another image, presumably a portrait of the lady he addressed, but every failure appeared to him to be a portrait of himself. "Do what I will," he says, "I can only carve my afflicted features." If the old Michel Angelo could express himself in that way his greatest admirer would admit that he was excessively vain, and we may therefore conclude that the madrigal is a revelation of youthful distress. For the same reason Vittoria Colonna, who was elevated above the ordinary weaknesses of women, would hardly be flattered by continuous allusions to the beauty of her face. She must have known that age had laid its hand upon her, and she was too ascetic to wish to become a second Cleopatra, who could not be withered by years. It would not please her then to be told by the artist that a beautiful face could transport him to heaven, and make him live among the elect in a circle where few mortals were admitted. Vittoria was sensible, for she was a reformer, which was a dangerous vocation at the time, and with her sense of duty it would not be complimentary to be told that her votary could not turn away his eyes from hers without losing the light which was to show him the path to Paradise, an idea which is an anticipation of Tom Moore's lyrics. Vittoria was besides a widow, for she had married the Marquis Pascara, and the allusions therefore to a damsel would not be applicable to her, although in no other way could he address Luigia de' Medici. For instance, in the fourteenth madrigal he says, "Natura ogni valore ogni bellezza in donna ed in donzella pose."

From what he writes about Vittoria it would not be difficult to make a portrait of her, for Michel Angelo not only suggests the form of the features, the colour of the hair, the character of the complexion and peculiarities of costume, which probably were not often changed, for the lady was puritanic, but also recalls the honest, frank expression which was natural to a woman of her character. It was known to many that Michel Angelo admired Madame Pascara, and apparently he made no effort to conceal that fact. But, as we have said before, it would be a crime to give any indication of the Medicean princess. The poet does not mention her name, but he is careful to avoid saying one word which his enemies or rivals could turn to his disadvantage and which would wound her susceptibilities. We do not profess to be able to discriminate between the two or more series of poems which are to be found in the collection, but we believe they could not have a common origin, and that if carefully studied by artists who can appreciate the peculiar turns of thought they would afford a revelation of Michel Angelo's inner life, and become a mental biography of the painter, sculptor and architect.

It is certain, however, that any reader who comes to the perusal with an unbiassed mind will allow that the common theory about Vittoria Colonna being the sole inspirer of the sonnets and madrigals can only be acceptable by supposing that Michel was an unskilled poet, and could not adapt himself to circumstances, or that the elderly pair used to recreate themselves by philandering as a boy and girl who were in love's first dream.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, Professor Aitchison, R.A., president, in the chair.

The Hon. Secretary announced the decease of Henry Bridgford, elected Fellow in 1888, and of Professor Hayter Lewis, who was elected Associate 1845, Fellow 1852. Professor Lewis was hon. secretary for a period, and had been twice elected vice-president, serving that office from 1865-67 and 1878-82.

On the motion of the President, seconded by Mr. John Slater, a vote of condolence with the relatives of Professor Hayter Lewis was passed.

The President announced that the Council had voted a sum of 10*l.* towards the memorial of the late Charles Garnier.

Mr. Bernard M. Drake read a paper on

Some Practical Hints on the Production and Use of Electricity for Lighting Country Houses.

Mr. Drake said that to the multifarious knowledge of the architect must now be added a grasp of the "practics" of electric lighting and its attendant paraphernalia. He should confine himself to the practical points which crop up daily in an architect's office, and are searched for in vain amongst the text-books at his disposal. In lighting a country house, the first question concerns the provision to be made for the generating plant, and where it shall be put. The various developed methods at disposal are:—(1) Steam-engine; (2) petroleum engine; (3) gas engine; (4) water-wheel or turbine; (5) wind engine; (6) primary battery. The advantages and disadvantages of each method were fully considered by the author, whose own experience was that a combination of gas and petroleum, or turbine and steam-engine, gave the best results. Each case, however, required an individual study of the local conditions and working requirements before deciding what would be best; it was not a matter which could be safely left to the decorator or hot-water engineer to diagnose. From whatever source the power is obtained, the dynamo for ordinary requirements is the same, except that it requires to be fitted with a flywheel for use with petroleum and slow-speed gas-engines, providing the engine has to be run while the lights are used. Where only required for charging the accumulators this may be omitted, as it wastes power. The most important features in the dynamo for country-house lighting are:—1. Absence of sparking, which wears out both brushes and commutator; 2, perfect balance of the armature or revolving portion of machine, vibration being one of the causes of what are known as flats on the commutator; 3, strong shaft and wide bearings; 4, good automatic lubrication, the best form being a loose ring revolving in an oil bath; 5, absence of heating—undue heating of the armature and magnets causing unnecessary loss of efficiency. The accumulator is a necessity in every country-house installation, and the position of the room for its accommodation requires careful consideration. For reasonable distances up to 150 yards the engine and accumulator-rooms should be placed alongside each other, as the attendant can see that each cell charges up equally, which is essential to success. Where the current is brought from a distance, or where the light will always be supplied from the accumulator alone, a considerable saving can be made in the cost of cables by separating the engine and battery-room. There must be no direct communication between the dynamo and cell-room, or the cotton insulation will be found to rot off the dynamo after a few years. In selecting a type of accumulator the main question is absence of attention, which can only be obtained by having the

plates well apart, say half an inch, so that any detached portions fall away instead of bridging across and exhausting the cell. The author considered that a clear space between the plates was also preferable to enclosing them in any form of celluloid bags or wrappings, which soon become clogged with oxides. The use of a registering meter is recommended in the engine-room as the best check on the amount of coal, oil or gas consumed. The engine-house should be placed with due regard to prevailing wind, and not less than 50 yards from the main building. The author next considered the questions of first cost and working cost, giving data applicable to average country-house installations, from which also could be determined the class of motive power to be adopted. Results were also given of a week's recent test with a modern generating plant for a large installation of 2,000 lights. In discussing the lighting of rooms the author emphasised the necessity of having light and dark portions and, as it were, semi-tones. A room lit equally throughout gives a flat effect, and is neither artistic nor restful. A bright light causes an involuntary contraction of the pupil of the eye, and causes a tired feeling which may ultimately result in eye troubles. The ignorance of electricians concerning this simple fact is probably responsible for the complications ascribed by oculists to the electric light itself. The secret of a restful light is the illumination of a large surface with an absence of any dazzling spots of small area. In a room thus lit the pupil of the eye expands to its full limit, and the weakest eyes can read with comfort. To get this result either the rays must be diffused by transmitting them through a large shade, or reflection must be resorted to and the direct rays be projected on the walls and ceiling from some hidden source. The illuminated surface is then greater than that of even the largest shades and the effect more restful. This treatment in the case of light-coloured walls and ceiling is capable of wide adaptation. A combined shelf and picture rail containing a row of hidden lamps for reflected light had been employed by the author, and pretty effects could also be produced with small lamps concealed in the overmantel and in china cabinets. Coming to the question of fittings in old houses, the existing candle fittings have often to be adapted, as being in accordance with the style of the room. As regards the objection that imitation candles are inartistic, it must be remembered that the designer had the candle in view as the basis of his outline, and without it the proportions are wrong and the drip cups and other parts meaningless. An incandescent lamp springing direct from a candle socket is a squat abortion that has nothing to commend it. In these cases every effort should be made to get the precise effect of candles without their disadvantages, and as far as possible to conceal the fact that electric light has been employed. Examples were shown of the way in which old fittings may be treated without detriment to their appearance, and attention was called to the economy of shading only the front of lamps placed against a wall, for thus the full advantage of reflection is obtained, and an 8 candle-power lamp will take the place of a 16 candle-power if totally enclosed. There were also shown a few typical fittings made expressly for electric light. Having touched upon the fittest materials for shades, the colours of which should be tested before making a selection; the objections to working the lamps into plaster-work in the ceilings instead of using metal fittings; the precautions to be taken to avoid risk of fire from the heated lamps, the author concluded with some hints on the treatment of the different rooms, passages and staircases. In adapting candle fittings to a dining-room table the wires are distributed by a patent connector lying under the table centre, and neither the table nor the cloth is pierced. One of the best effects produced by the author was in the dining-room at Chatsworth, where powerful lamps were hidden in reflectors at the base of the pictures all round the room; thus pictures and ceiling were illuminated and the rest of the room remained in repose. In drawing-rooms, which should be brilliantly lighted, the author preferred o light principally from the walls and from standards, as a top light is unbecoming to ladies, causing dark shadows under the eyes. In picture lighting top as well as base reflectors are frequently necessary with large pictures.

A second paper on

Practical Applications of Electrical Power

was read by Mr. H. R. J. Burstall. In defining the scope of his paper the author said he proposed to deal with the general principles underlying the application of electrical power, to describe a few typical forms of apparatus, and to discuss the question of the cost of power under ordinary circumstances. Electrical power, as distinct from lighting, in buildings for non-manufacturing purposes, may be generally applied to, roughly, five classes of use—lifting and hoisting; ventilating; driving machinery for small trades and for domestic purposes; pumping; heating and cooking. In all except the last class electrical power is applied by means of electric motors, the type varying according to the purpose for which the motor is required. Most motors are supplied from a continuous current system, the electrical pressure varying from 100 to nearly 500 volts, 200 to 250 volts being the most usual. Describing the general type of motor and its method of working, the author showed that the regulation of speed and power in it is carried out entirely by electrical methods, no sort of governor, as in a steam or gas engine, being as a rule required. Motors used for the purposes under consideration are usually supplied at a constant electrical pressure, and generally made in three types. Where constant speed is required, a shunt-wound motor is used. When a large turning effort is required and not a constant speed, a series motor is used. A compound type is employed in certain cases. It is sufficient to know not only the power required for a particular purpose, but also the conditions of running, before selecting the type of motor desired, and this selection can only be made from previous knowledge of the work or by experiment under working conditions. The author explained how the motors were regulated to avoid waste of energy. The speeds of electric motors, as usually supplied, range from 1,000 to 1,500 revolutions per minute for sizes from one to five horse-power; but motors running at from 200 to 500 revolutions per minute can now be had at reasonable prices. Slow-speed motors are largely on the increase, the extra first cost being compensated for by the reduced wear and tear and by the advantage gained through direct coupling the motors to the machines. The special machinery and apparatus required in the application of electrical power to each of the five uses above mentioned were next discussed and described. In lifts, although the broad principle of electrically driving them is quite a simple one, the actual machinery has to be most carefully designed and arranged, special motors and switches and gear being employed to insure efficiency and economy. In ventilation electric motors form the best driving power for operating fans, whether large fans for the ventilation of a building on some complete system, or small fans for extracting the air from particular rooms, or even for stirring up the air in any room in the manner of a punkah. Special care is required to avoid the noise of the machinery, and fan and motor should, wherever possible, be carried not from the sides of the air trunk, but quite separately from a substantial wall. Noise is often caused by the pulsations of the air set up by the improperly shaped blades of the fan. In this case little can be done except to alter the fan. The loss during transformations of energy from the boiler furnace at the generating station to the coils in the heating apparatus is so considerable that heating by electricity cannot compete with direct heating by means of gas or coal for any purpose where a large quantity of heat is required. As, however, ordinary heating operations in a house are carried on under conditions in which the heat utilised is but a small proportion of that generated, it is possible, by properly applying the electric energy, to use such a large proportion of the energy as heat that competition with coal and gas is rendered possible when other considerations as to dirt, &c., are taken into account. Generally speaking, heating by electricity is applied by passing a current through coils of wire of high resistance; the wires are embedded in an insulating covering, and are heated, together with their covering, to the temperature required. Another method, in the author's opinion of great value, is to pass the current through a number of glow lamps, the lamps being proportioned so that their filaments are not completely incandesced, the room then being heated by radiation as with an ordinary fire or gas stove. The lamps are arranged in special reflectors so as to obtain a "beam" of heat rays. The apparatus is simple, easily fitted and understood, and free from risk of breakdown. The heat obtained being radiant heat, does not produce the enervating feeling produced more or less by all methods of heating by warming the air, and the effect produced is similar to that from an incandescent gas stove or bright red coal fire. The author then discussed the question of cost. Electrical energy is charged for at the rate of so much per Board of Trade unit, a unit being an amount of electricity which will keep an eight candle-power lamp alight for about thirty-five hours. This amount of energy is equivalent to 1·34 horse-power exerted for one hour. The Corporation of Edinburgh charge 1½*d.* a unit for power. In London the average charge is from 3*d.* to 4*d.* Private installation on a reasonably large scale, and economically worked, would cost at from 2*d.* to 3*d.* per unit. A passenger-lift for carrying nine persons, running at a speed of 175 feet per minute, will require about 0·06 units per journey, taking the average of the day's work. This, at 4*d.* per unit, will work out at about one farthing per journey. In ventilating, generally and very approximately speaking, 1 horse-power is required to deal with 20,000 cubic feet per minute, which would correspond to about ¾ of a unit per hour, and, at 4*d.* per unit, would cost 3*d.* per hour. Small machinery may be driven by electrical power for 54 hours per week at a cost of 48*l.* 6*s.* per actual horse-power per annum. An electrical pump. 1 horse-power, will require the expenditure of about 1½ unit per hour. For heating, an ordinary electrical radiator suitable for a small room, costs, at 4*d.* per unit, from 4*d.* to 8*d.* per hour. The Dowsing glow-lamp radiators require about ¼ unit per lamp,

and a radiator of four lamps, sufficient for a small room, would cost 4*d.* per hour at the 4*d.* rate. An appendix to the paper gave a number of figures in tabular form as to the cost of cooking apparatus. In installing electrical machinery the regulations of the various fire offices as to the use of electric motors should be borne in mind so as to avoid any trouble after the apparatus is installed.

Remarks were made on the papers by Messrs. E. W. Monkhouse, John Slater, Beresford Pite and E. W. Hudson.

DEMOLITIONS IN FLORENCE.

THE following reply to the memorial addressed to him on "The Proposed Demolitions at Florence" has been sent by the Marchese Pietro Torrigiani, the sindaco or mayor, to Sir Edward Poynter and other signatories :—

Gentlemen,—The memorial you have addressed to me regarding the alleged proposal to demolish ancient edifices important in Florentine history and art has greatly surprised me, though at the same time, as a Florentine, I cannot but feel a certain pride in thinking that our precious monuments should be so well known abroad and that men of your eminence should make themselves the mouthpiece to urge their conservation. Rest assured, however, that the vandalisms feared do not and could not enter into the programme of the Florentine civic administration, which, chosen by the votes of the citizens themselves, has ever had a full cognisance of the duties imposed upon it as guardian of the treasures and the interests of the citizens. The information that has been supplied to you must be based upon a misconception of those who have thought that the colonnade between Porta Rossa and Piazza San Biagio was a continuation of that of Piazza Vittorio Emanuele, instead of being merely the end of the work of resanitation of the part of the city formerly called the centro.

When the Communal Council was called in 1886 to choose definitely from among numerous projects drawn up to liberate Florence from the shame and detriment devolved upon her by the existence of those quarters comprised between the Vie Tornabuoni, Cerretani, Calzaioli, and Porta Rossa and the Piazze del Duomo and San Biagio, the one accepted was that which endeavoured to reconcile all the various desires the citizens had for many years expressed. This did, indeed, contain a plan to continue the colonnade of the resanitated centro as far as Via Cerretani on one side and the Ponte Vecchio on the other, which project would have met the wish to procure to the city the advantage of a prolonged colonnade that should connect with the Lung 'Arno degli Archibusieri and that of the Uffizi. But that portion of the plan which was accurately studied in every detail, and which was sanctioned by Royal decree and by the application of a special sanitation law, did not extend beyond the ancient Via dei Boni, now Via Pecori, on one side and the Palazzo Canacci on the other. It is this plan alone which has been put into execution and which will be completed. The other portion of the colonnade, merely drawn as a project, could not and would not be effectuated for many years to come, as the Commune is already engaged in too many works of public utility to undertake any other not called for, as was that of the centro, by the supreme exigencies of hygiene, morality and public safety. This I have already declared in a sitting of the Communal Council which took place May 30, 1897, when the council decreed to acquire Palazzi Giandonati and Canacci. More than this, the historical artistic commission charged by the Commune to watch over the demolitions and excavations of the centro desired to obviate the possibility of the suspicion that we have been careless of the importance of certain historical edifices, which by the rough project of this plan seemed threatened with destruction if the colonnade had been continued. (These plans did not, however, comprise all those named in your memorial, and to which you thought it needful to draw my attention, almost as though you imagined me not aware of their existence.) In consideration, therefore, of the historical and artistic value of these edifices, which the Commune fully apprehends, the commission presided over by me, in its meeting held May 20, 1897, nominated a sub-committee charged to study how to reconcile the construction of the colonnade without prejudice to the edifices that merit preservation, and both this sub-committee and the Municipal Technical Office have carried out their tasks with happy results. And so well did these results correspond with the desired aim that the Society for the Defence of Old Florence, constituted under the presidency of Prince Corsini on May 15, 1898, on presenting me with its statute on June 15, 1898, could only express a desire in conformity with that already expressed by the sub-committee on March 30, 1898.

Make yourselves easy, gentlemen, that the Commune has for the moment no intention whatever of adventuring upon any works not demanded by the requirements that modern life imposes in the interests of hygiene, viability and commerce. Should these demand fresh demolitions, our Administration will leave behind it the elements for computing them without destroying buildings precious to history or art.

As to the Ponte Vecchio, or the houses upon it, no one has contemplated this destruction. Concerning the squalid quarters that are interposed between Borgo San Jacopo, Sdruccioli dei Pitti, Via Maggio and Via Guicciardini, whenever this needful sanitation be taken in hand there is no intention of destroying any such houses or characteristic towers as can be preserved in the interests of hygiene.

You, gentlemen, have expressed to me your emphatic protest against the irreparable injury of imaginary demolitions, and I, on my part, can but protest as emphatically against the suspicions involved in your memorial that the civic representation of Florence is careless of its own historic and artistic monuments.—I have the honour to be, gentlemen,

Pietro Torrigiani, the Syndic of Florence.

DEPARTMENT OF ANTIQUITIES IN EGYPT.

IN a letter to the *Times* Mr. John Ward, F.S.A., writes:—The French Government left us alone in 1882 to carry out the saving of Egypt from rebellion and restore the finances of the country if we could. We have done both, made good soldiers of her sons, who reconquered the Soudan under our generalship. We are now engaged in doubling the supplies of irrigation, and so increasing the wealth of the land in a similar degree. We have been sixteen years employed thus. During all this time we have allowed the French to control the important Department of Antiquities—that is, the Cairo Museum—and any antiquity in the land, whether discovered long ago or still unearthed. All the chief officials of the Department are Frenchmen selected in Paris, and all their inspectors and underlings are selected by the head of the Department. The museum is in great need of attention; few of the exhibits are labelled, and those labelled are in French. Nine-tenths of the visitors are English-speaking tourists and residents speaking Arabic. A new museum is much needed, as the Gizeh Palace was condemned six years ago as being a very hazardous structure in case of fire. The Administration of Antiquities undertook to provide a new museum in Cairo. Plans were selected and a contract accepted for this much-needed work some three years ago. The foundations were found insufficient to bear the structure, and all the work has been stopped for upwards of a year. Had this new museum been in Sir William Garstin's hands it would have been far advanced towards completion. In all appearance there will not be a new museum unless we undertake, as we ought to do, the sole direction of this important Department.

Another great abuse exists. The French have sole control of the antiquities in the neighbourhood of Cairo and of the entire Pyramid fields, extending for 70 miles, along the Nile. There are no custodians of these monuments (save a few tombs at Sakkarah), and the Great Pyramids and Sphinx are left to the mercies of the Bedouin Arabs, who rifle the tombs and sell the spoil. There are 10,000 tombs as yet unscientifically explored, it is believed, by competent authorities. The neighbourhood of the Great Pyramid is unsafe, and there is no proper police force within 7 miles. A friend of mine told me recently that his two daughters went up the Great Pyramid (he, being an aged man, could not go). They had travelled about the world, and thought the country, being under English protection, would be quite safe. They were followed up the Pyramid by two wild, fierce Arabs, who terrified them, threatening to throw them down the steep sides if they did not deliver up their money, which they did. Their father could not wait to prosecute, as their steamer was to sail the next day. There is another grievance of the French management, that when Mr. Petrie was anxious to explore the Pyramid cemeteries (as he did the Pyramids themselves in 1880) he was refused. The director said he wanted to keep those places for himself. By the way, the excuse for not appointing custodians over this district is an idle tale that Napoleon derived some aid from the men of this tribe, and pledged his royal word that they should never be interfered with. The Society for Preservation of Ancient Monuments of Egypt (founded by Sir Edward J. Poynter, P.R.A.) brought pressure to bear when the tombs of Beni Hasan were plundered in 1889, and guardians and iron gates were put on all important monuments of Upper Egypt. But in Lower Egypt, with 100 visitors to every monument for one in other places, no care whatever is taken of the finest monuments in the world.

No person is allowed to make excavations without official authority—that is a good rule. But how is it carried out? The Arabs dig where they please and sell their stolen goods to the museum authorities; one well-known dealer got 2,000*l.* recently for things he had rifled from a tomb. They sell the smaller finds openly, and the dealers ship them to America. But if Mr. Petrie, for example, wants to excavate anywhere, he is kept waiting months before he gets a reply, and then is not

given the place he wants. Of course everything he finds is offered to the museum. But if a Frenchman wants to dig the case is different. Before Mr. de Morgan resigned his charge of the museum he licensed M. Amélineau, of Paris, to dig where he pleased for five years. It is feared that many of the important discoveries made by this gentleman may have had no scientific record made of them. It is very important that all "finds" of forgotten dynasties should be registered for use of patient investigators. Mr. Petrie and Mr. Naville (acting for the English Egypt Exploration Fund) always publish clear scientific records of all their researches. Mr. de Morgan, when director, also published scientific accounts of his finds (which were made with the public funds of Egypt), but all his reports were printed in the French language, and were not available to the visitors of the museum without purchasing them at a very high price.

As you say in the *Times* of November 30, "There is no nation in the world except ourselves that would tolerate such treatment," and it is high time for the British to take the antiquities and the new museum in hand. The museum should have all labels with at least French and Arabic, and every article correctly named.

CRICHTON PARISH CHURCH.

TO claim to have the most-vandalised pre-Reformation church in Scotland is, says the *Scotsman*, no mean bid for distinction in a country where the heritor has been abroad in the land for so long, and where "heritor's Gothic" has become at once a classification and a reproach; and yet the parishioners of Crichton need have small fear of their claim to such notoriety being refuted. It will take a big record indeed to break theirs.

Given a beautiful Gothic church, with chancel, tower and transepts—the nave was never finished; with ashlar stone interior and lofty vaulted roof 30 feet high; with stone-mullioned and cusped-tracery windows of gorgeous mouldings; given this, and the problem being how best to vandalise it—here is how the heritors in whose charge the ancient collegiate kirk of Crichtoun was left solved the problem. By walling-off the chancel from the transepts to begin with, thus obtaining a fine rectangular interior exactly suited for galleries. By erecting three galleries round this chancel, placing the pulpit on one of the longer sides, which necessitated the building up of the two original doorways and the complete or partial building up of three original windows, and the consequent cutting of new doors and windows to take their place. By erecting two great porches without and by wainscotting and ochreing the walls within. And, finally, by using one transept for a family vault and the other for the gravedigger's tools, the large windows of both being built up with stone and lime rubble.

It may be suspected that this description is not without a touch of caricature. The fact remains that all this vandalism was actually carried into effect. Of the original seven windows three and a half were built up, and three new ones were cut out in their place—through walls 4 feet 6 inches in thickness, too. Two of the new gallery doors were through old windows; even humour, in the lack of reverence, might have saved the heritors from the perpetration of this atrocity. But they had none. It was a matter of no importance how the worshippers entered, whether by door or window. The base was hacked from the sedilia; the hole for a gallery beam was cloured in the top of one panel; the three panels were filled with lath and plaster, flush with the wall. The rich capitals on the pillars of the chancel arch suffered a like fate in the interests of gallery beams; even the moulding of the arch itself could not be plastered over before it had been hacked and scarred. One indignity only did the poor old building escape, and that was, indeed, proposed in all seriousness by one of her worthy elders, anxious to add to the tale of the heritors' enormities. "You see, sir" (this is the minister), "I've been having my parlour done up, and the painter has just made the ceiling beautiful. All that our church needs is to have a nice light paper put on to cover the old dirty stone."

Of course the explanation of all this Philistinism was that by this means the heritors were enabled to enjoy the privilege of privacy, or at least of exclusiveness in their public worship. The chief heritor had his private gallery under the chancel arch, with his own wooden stair, once painted white, leading up to it; three other heritors had the gallery opposite the pulpit for their own exclusive use, with special porch and two separate doorways. The third gallery was for the village folks; the farmers and their hinds sat below. It was a perfect arrangement. So much so, that in the Statistical Account of 1845 we read that "within the last twenty years the church has undergone a thorough repair, and is now one of the most handsome and comfortable in all the country."

The church stands on the bank of the infant Tyne some 400 yards north of Crichton Castle, and was founded by Chancellor Crichton in 1449 "in thankfulness and gratitude to Almighty God for all the manifold deliverances He had vouchsafed to him." It was at that time that the greater part of the castle—familiar to all students of Marmion—was built by the chancellor. Messrs. Macgibbon and Ross tell us that probably the same masons were employed on both.

It may be of interest to the public to know that the church is at present being restored to some of its former beauty. For the old building a brighter day has dawned in the history of its fortunes, so far, at least, as the heritors are concerned; for it is in great measure by the splendid liberality of the chief of them, and under his personal supervision, that the present restoration is being carried out.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE monthly meeting of the Glasgow Archæological Society was held in the rooms, 207 Bath Street, Glasgow, on the 15th inst., Mr. George Neilson, vice-president, in the chair.

Mr. Brydall, St. George's Art School, read a notice of "Arms and Armour at Eglinton Castle, and Scottish Swords," &c. The first part of the paper dealt with armour and arms at Eglinton Castle, and described two sixteenth-century suits of armour—one, finely engraved and gilt, having been worn by the father of the present Earl at the Eglinton tournament. In the same collection is a German war saddle of the fifteenth century, covered with bone or ivory, and beautifully engraved, as well as two glaives and a halbard. An account was given of the two-handed swords of the Laird of Lundie and the one, formerly in Clackmannan Tower, with which Catherine Bruce knighted the poet Burns and Dr. Adair, remarking that she had as good a right to confer the title as some other people. The use and method of handling these huge weapons were explained and described. Notice of a fine silver-handled Ferrara broadsword which belonged to Viscount Dundee gave Mr. Brydall an opportunity of bringing together and up to date the few facts known of the smith so famous in Scotland for his sword blades. Andrea Ferrara was in business with his brother Giovan Donata in Belluno, in Friuli, about the year 1585, long before which Ferrara blades were made. Piero Ferrara was a contemporary and Cosmo Ferrara was about two generations earlier. The handle of the Scottish broadsword, sometimes confounded with that of the claymore, was the same as those carried by the guards of the Venetian doges. The paper concluded with notes on ancient spurs and stirrups, and was illustrated by highly-finished drawings from the originals.

Mr. James White read a paper on "The Old Lands of Partick and the Mills Thereof." He stated that the old lands of Partick, according to the old rental of the university, showed that the barony of Glasgow was divided into four wards—these being Partick, Govan, Badir-manok and Cuikis. Speaking generally these old rentals showed that the old Glasgow of to-day was on the old lands of Partick, while the Partick of to-day was on the Govan lands. The lands of Govan included all the barony to the south of the Clyde, nearly all of it west of the Kelvin, and the ward of Partick extended from the Clyde to Cadder and from the Kelvin to Shettleston. One interesting fact was that in 1596 one side of the Molendinar was in Partick and the other side in Glasgow. The farmers of the Partick and Govan wards were restricted and bound to grind their corn at the mill of Partick, the district thirled being called sucken and the payment named multure. During the months of May and June 1893 a number of letters appeared in the *Glasgow Herald* on this subject, but the writers of these were unable to arrive at any decision. From the papers he was showing he thought he could prove the accuracy of all the mills of Partick, of which there were four—two waulk mills, one wheat mill and one meal mill. The meal mill was the mill of Partick, otherwise known as the Archbishop's Baronial Mill, and was supposed to have been built in 1136. That was the real Glasgow mill. The first waulk mill was built in 1507, the second in 1517; the bakers built their own wheat mill in 1568. A most interesting fact occurred when, on April 1, 1571, Crauford took the castle of Dumbarton. For that he received a gift of the mill of Partick, which was the most valuable possession belonging to the cathedral in those days, and was still the largest payer to the cathedral in the old victual payment. Crauford granted a bursary—known as the Crauford or Bishop's Bursary—to the university in 1576. In 1577 Crauford built the old bridge at Partick, which crossed the Kelvin at his mill. The Bishop of Glasgow pressed Crauford to give up the mill, so in April 1599 he resigned it into the hands of the bishop. Early in 1608 the city of Glasgow found itself in debt, and the only way out of it was to get a monopoly of the mills; and the whole city, Dean of Guild, and merchants and others agreed to be thirled in that year, but when the city leased the mills they were not allowed to multure from the tenants grinding at the mill.

At the close of the papers the authors received votes of thanks.

NOTES AND COMMENTS.

The intimation given to the Metropolitan Asylums Board by the solicitors of Messrs. Kirk & Randall, the contractors, that the firm claimed 34,445*l.* for delays in the erection of the Grove Hospital caused by the non-supply of drawings or imperfect ones, and delay in the supply of drawings by the Board's architect, is a serious affair for the Managers and the ratepayers of London. The subject has been referred to the works committee, and will of course receive serious consideration. In a case of the kind it is difficult to fix or to apportion the liability, for an architect may be alone at fault, but if the employer has contracted that plans are to be supplied at a fixed time, and they are withheld, then of course he is responsible for the architect's delay, just as in a case of ordinary agency. But if there is no express stipulation about the furnishing of plans, the courts are likely to assume that one is implied, and the case will then turn on what is the length of the period within which the plans should have been given. That a contractor reckoned on delay in receiving plans as one of the contingencies for which he was to be prepared is a plea which a judge could not be easily persuaded to accept.

Copies of Parliamentary plans are occasionally valuable to railway companies, for as the number printed is limited there is a possibility that after several years a copy for reference may not be forthcoming. But there is no public interest in such documents, and they are not to be found in the British Museum or Record Office. Plans sometimes find their way to waste-paper shops, where they are treated with no more respect than newspapers or transactions of learned societies. It was therefore a remarkable event when on Monday a sum of twenty-six guineas was paid for a copy of the plan lodged in 1832 for the London and Birmingham Railway. It had undoubted historic interest, and was the more rare because the copy lodged in the Private Bill Office was destroyed by the fire of 1834, which afforded Charles Barry his great opportunity. The scale is the usual 4 inches to a mile. The Act received the Royal assent on May 6, 1833. Two years after another Act was passed for extending the line from Camden Town, which was intended to be the original terminus, to Euston Grove. The works were commenced in June 1834. The section to Boxmoor was opened in July 1837, and as far as Tring in the following October. In April 1838 the extension to Denbigh Hall was completed, and the part between Birmingham and Rugby. The passenger traffic between Rugby and Denbigh Hall was worked for five months on the high roads by ordinary coaches. George and Robert Stephenson were the engineers, but the work was mainly overlooked by the latter.

It is understood in Belfast that Mr. William Henman, of Birmingham, will be selected as architect for the new Royal Hospital. The buildings will cost at least 150,000*l.* There are a great many architects in the Ulster capital, and a work of that magnitude would be a boon to the majority of them. But there is no organisation and little *esprit de corps*, and as a consequence there is a tendency to accept low fees in order to secure commissions. Besides, it is common to submit to the caprices of clients to an extent that is not professional. It cannot be said that the bestowal of an important commission on a stranger is considered as unsatisfactory by all the architects who live in Belfast. There will be no chance of the adoption of the Dutch auction principle in order to discover the architect who will accept the smallest commission, and when the precedent of sticking to an established custom is once adopted, there is a chance that fair play will eventually prevail.

It is time the Doges' Palace in Venice should be treated as the Parthenon, or, in other words, regarded as an international treasure. If we read between the lines of the reports which are in circulation it becomes plain there are at least two parties of officials at war over the building. The Council of Fine Arts in Rome decline to be responsible for the safety of the palace, while the Fine Arts Minister maintains there is not even "a shadow of danger." The official architects in Venice confirm the view, while many of the unofficial architects consider the building is settling, owing to disturbances of the walls caused by sinking of the foundations. Every architect who has visited Venice and studied the buildings knows that for years past there have been apprehensions about the safety, not only of the palace, but of other important buildings. Officialdom will not deliberate about the means to be adopted to insure safety, but in a despotic way insists on the carrying out of its peculiar remedies, which are not always of a kind to inspire confidence. What should be done would be to invoke the judgment of foreign experts who have had experience in riverside work. A report by a few English and Dutch architects would be more reassuring to those who love Venice than any declarations in the Roman Parliament House or official reports. Meanwhile, it would lighten the load on the walls by the removal of all the old books in the library, or whatever can cause a catastrophe on the smallest scale.

According to Mr. Baillargé, the city engineer of Quebec, wind is very freakish in its effects in his city. He mentions a case where four octagonal kiosks were unaffected by a gale, whilst a fifth, which was in the midst of them, "had its sheeting bent, twisted and torn off, while the entire roof framing of cast and wrought-iron, well bolted together, was wrenched from its eight supporting columns. The whole roof, weighing 2½ tons, was raised to a height of some 40 feet, and carried a distance of about 300 feet, where it was dropped in a broken condition on the glacis in the rear of the terrace." The stress on the roof must at least have been 100 to 120 lbs. per square foot, yet the anemometer recorded only 59 lbs. Mr. Baillargé considers that the anemometer is affected by the wind which, passing round its periphery, sucks out the air behind it, and creates a vacuum against which the atmospheric pressure on the opposite side reacts. He considers that with long narrow surfaces, such as bridges, anemometrical pressures can still be relied on.

A battle of styles has commenced in Nuremberg. The *casus belli* is a design for the new theatre. Herr Seeling, of Berlin, who is a specialist, was asked to give a design. Instead of adopting the Classic, which makes Berlin appear as if it were turned out of a mould and was an iron casting occasionally covered with paint, he employed the picturesque, if fantastic, style which is associated with Nuremberg. The design was no sooner seen than it gave rise to controversy. Artists and amateurs took sides with alacrity, as if they were glad of any occasion to break the monotony of everyday life. According to one party of æstheticians the Nuremberg style is peculiarly unfitted for theatres. The façade, it is said, should indicate the character of the building, and that is impossible if many-curved gables, bow windows, and figures of strange animals are liberally introduced. Evidently there are men in the old city who believe that for theatres Semper was the law-giver. Herr Seeling is not to be convinced by the arguments of his adversaries, and the more they say against his design the stronger becomes his conviction that the style he has adopted is the only one suited to the place. He is opposed to the commonplace style which was adopted at an earlier time, and which is evidence of the influence which French architecture, however debased, exercised in Germany. But it is said in reply that the old architects who designed the Nuremberg mansions simply adopted the style which generally prevailed in their time, and why should not their successors imitate them? The best modern theatres, it is said, are the realisation of conclusions which are derived from utility, and their purpose is made as manifest as if expressed in words. The new Nuremberg theatre should be no less convincing to the spectator. Herr Seeling maintains that his building will also be declaratory of its use, although in keeping with those which make the town attractive. How the battle is to end cannot be foreseen, but whatever is the result it is interesting to have definite principles inspiring the combatants.

VI.

Le Mans.

DURING the two days and a half which we devoted to studying the architectural glories of Le Mans, we saw the choir of its cathedral—the work as of angel architects *—under every condition. Never did it look lovelier than about half-past seven on the first evening of our visit, when the setting sun was dyeing with gorgeous colours from the old stained-glass the choir piers,

whose light shafts
Cluster like stems in corn sheaves.

Modern improvement has robbed Le Mans of much of the charm it possessed for people of an artistic temperament. Indeed, the whole city between the railway station and the cathedral is as jejune as the Rue Jeanne d'Arc at Rouen, and what picturesque bits have escaped the clutches of the improver are fast disappearing, or are already doomed. The whole side of one street and those debouching from it—the Rue Gambetta—leading down to the river Sarthe from the Place de la République, had been removed at the time of our visit, and the eye rested upon a wilderness of rubbish, dreary in the extreme. Doubtless the removal of these old tortuous streets is to be rejoiced at from a sanitary point of view; but the best part of the city is, at the present writing, a symbol merely of the last quarter of a century. The backs and gables of the houses in the old parts of the city, and the odours around them, remind one not a little of the most densely peopled by-streets and lanes of old Chatham. Slate, brought in large quantities from Angers, fifty miles off, has been largely used in the construction of the houses, and in consequence imparts a dusky tint to these old and curious quarters of Le Mans, through which, sluggishly just here, the Sarthe pursues its course. Further down the river is most picturesque, admirably suited to boating, bathing and other aquatic pleasures, while the scenery bordering it is a replica of that so well known to lovers of "our river." Fields, polled willows, poplars, quickset hedges, mills, and so forth, forcibly assert the characteristic of British pasturage, accentuated by the briar-grown winding lane and the thatched cottage so dear to English minds.

But the whole of the old part of Le Mans is not unsavoury. That in the immediate vicinity of the cathedral is certainly clean and sweet; while from the summit of the steep declivity, through which a tunnel has been cut, or from the top of the flights of steps winding round the old walls with their remains of bastions, superb views of the surrounding country can be obtained. Few French cathedrals are more majestically situated than Le Mans. It is built almost north and south, but for the purposes of description we will assume that it orientates properly. It stands, as we have said, upon a species of plateau rising very abruptly on the riverside, but more gradually on the opposite one as approached from the railway station and the busy part of the city; in fact, there is a gentle rise in the ground at Le Mans all the way from the station to the cathedral.

Seen for the first time, the external outline of Le Mans Cathedral is not a little perplexing, owing to the situation of its tower, which, planted against the face of the southern arm, gives one the idea that it consists only of a very short nave and extravagantly grand apsidal transept. But behind this is the nave, long, low and quite invisible from the east. The plan, then, of this cathedral embraces a ten-bayed nave, whose

Le Mans Cathedral: from the S.E.

almost Byzantine-Romanesque character is quite unlike anything in the contiguous province of Normandy, and to which, early in the thirteenth century, shortly after the union of the province of Maine with the royal demesne, was added the present marvellous five-aisled choir, with its eleven chapels, which open not only from the procession path but from the sides of the choir. Being of much greater depth than the generality of chapels in French cathedrals, those at Le Mans impart a peculiarly *rayonnant* effect to the ground plan, and they are so arranged as to leave space for the introduction—with admirable effect—of a window between each. The transepts and south tower are somewhat later than the choir, not being completed till the fourteenth century. Nothing can be greater than the contrast between the long, low Romanesque nave, with its simple round-headed windows in aisles, clerestory and west front, and the soaring Decorated transepts and choir. Many features of interest are presented by this nave, severe though it be. In the shafts and voussoirs of the large Romanesque west window, imparting quite a southern air to it, we observe bands of a brown stone. Very noble is the central door in this grandly simple façade, which, with the outer

* The choir of Le Mans is contemporary with Chartres to whose rugged grandeur it forms a most striking contrast.

walls of the aisles and the lower part of the north transept and tower, are the only existing portions of the eleventh-century building. The upper portions of the nave were rebuilt in the twelfth century, the vaulting recalling that of some of the great Early Pointed churches of the South; while a gem in this severe setting is the southern portal, rivalling in richness the Port Royale of Chartres Cathedral, the north and south doors of Bourges, and one in St. Benigne at Dijon, with all of which it is contemporary (c. 1150).

The tower which, as we have said, adjoins the south arm, giving it the air of a very short nave, is Romanesque in its lower part, and was kept when the Middle Pointed architect removed the original transept. In its upper part the tower is Later Decorated, and built of a richly coloured granite. It terminates square with an iron tourelle at each corner, a larger tourelle, also of iron, surmounting a dome in the centre, and recalls in ensemble some of the rich Late Pointed towers of the adjacent province of Brittany. One feature in the exterior of Le Mans Cathedral strikes us very much, and that is the large Decorated window lighting the wall space above the arch opening from the low nave into the transepts, somewhat after the fashion of that at Gloucester Cathedral, and those eastern nave windows that one sees above the chancel arch in St. Mary Redcliffe, Bristol, Cirencester, Northleach, and other of those Third Pointed churches that form the pride and glory of Western England, though of course at Le Mans its position is reversed.

The exterior of the sacristy—a typal piece of French thirteenth-century work—has recently undergone restoration, and, as well as the chapels surrounding and flanking the choir, abuts upon the terraced gardens of the bishop's palace.

Let us enter—as everyone should enter this loveliest of French choirs—by a small door between two of the radiating chapels on the north, at the top of a long flight of steps. Oh for a mastery of vivid thought, for a wealth of picturing words, that we might adequately give an idea of the greatness and magnificence of this wondrous choir, where the most enthusiastic admirer of the beautiful must pause in sober certainty of having reached perfection. After having seen all those cathedrals entitled to a place in the first class—Amiens, Chartres, Paris, Rheims and Rouen—we may confidently affirm that we are at a loss to particularise any one the choir of which has, for beauty and solemnity, so indelibly impressed its features on the memory as a *chef d'œuvre* in design and execution as that of Le Mans. This ought to arose curiosity, but how many of the countless English visitors to Brittany ever think of returning to England through Paris by way of the old capital of Maine? Proceed we to put ever so faintly the details of this wonderful conception before the mind's eye of our readers.

Taking our stand beneath the eastern arch of the nave, we have on our left the luminous northern transept, with its vast east and west windows and glorious north rose, little inferior as regards its stonework to those in Rouen and Amiens Cathedrals, and showing few, if any, evidences of a declining age. What taste is evinced by the architect in every line and curve of this

Le Mans Cathedral: the Nave.

rose! What consummate skill and mathematical knowledge must have been brought to bear upon the delicate and almost unique fleur-de-lis tracery* of the row of windows below it! A neglected-looking altar, with candles tumbling all sorts of ways, and a heavy Classic reredos, sadly incongruous, but in some respects preferable to the miserable modern Gothic specimens of such instrumenta usually met with in France, reared against the wall, just under this triumph of the Mediæval artist, is too contemptible.

Turning to the right, we see in the south transept the gigantic organ in its Renaissance case with five towers. In front of it is the choir organ. Curious old figures in domed niches adorn the gallery front. The great steeple's abutment precludes a rose here, but floods of light are poured in through the immense east and west windows of this transept. Grandly traceried and of eight lights apiece, they must be among the

* The fleur de lis occurs in the tracery of the aisles of Troyes Cathedral.

largest in France. In front of us are five arches. The centre one, 104 feet high, opens into the matchless choir; right and left is a narrower one, of the same height as the choir arcades, and opening into the first aisle. This is furnished with its own arcade, triforium and clerestory. Another arch, much lower than the other, admits to the outer choir aisle, opening in its turn to the chapels. To square piers are attached slender, reed-like shafts with exquisitely foliaged capitals, from which spring the moulded arches — perfect specimens of Middle Pointed work—of the three bays forming the choir proper. In the apse the architect has given us coupled cylindrical pillars with a slender shaft fixed in where the two join, for stability of effect. Although very tall, the height of these arcades is not exaggerated like those at Beauvais—all charms without overwhelming you. The triforium, usually round the choir, is in this cathedral, as at Coutances and Bourges, transferred to the first aisle, an arcade of trefoils running below the clerestory here taking its place. The painted glass filling the clerestory windows, some of which are of two lights, others of four and even six, rivals that at Chartres in brilliancy if not in profusion.

Turn we now to the inner circumambient aisle, where it is apparent that nothing was spared which could add to the embellishment or excellence of the work, so long as it continued, making one regret that the chapter were compelled to relinquish what was no doubt their original intention—the reconstruction of the nave on a scale of similar magnificence. This is separated from the outer one by a continuous range of richly moulded arches on cylindrical pillars, really of large proportions, but dwarfed by the huge dimensions of those in the choir proper, and whose capitals, carved in varied conventional foliage, must be unrivalled for combined elegance and majesty. Above this arcade is a triforium equally noble in its conception, where the delicacy and refinement evinced in the carving of the shafts, capitals and tympana brings to mind Lincoln, Beverley, Westminster and York. For clerestory we see here varying numbers of uncusped lancets, diminishing in height with the slope of the arch containing them, and glowing with old glass.

Opening from the outer aisle are the eleven apsidal chapels in the Lancet style of the thirteenth century, and therefore the earliest portion of the grandly rebuilt choir. The longest of these is the lady chapel, carefully restored five-and-thirty years ago, when very extensive mural paintings once more saw the light. The parallel sides of this chapel are lighted by three windows of two uncusped lights each, with a quatrefoiled circlet in the head; the apse has five lancets. Here again the old glass rivets our attention; indeed, the violet hues of its gloriously painted quarries are only surpassed by those in the Sainte-Chapelle at Paris.

The other ten radiating chapels, although much deeper than those ordinarily met with round the choirs of France, are not so long as the lady chapel. Each is apsidal with a triplet of lancets, and has a triple dedication. One, however, on the south side—that of St. Gervais, St. Etienne and St. Protais—has its lancets filled with Middle Pointed tracery and modern stained-glass to match. The figures, placed under conventional canopies of a type employed by Messrs. Clayton & Bell in such of their earlier works as those in the apses of St. Mary's, Stoke Newington, Exeter College Chapel and elsewhere, are of unusually good and bright tinctures. A very grandiose portal in the richest and most voluptuous Italian Renaissance protects the chapel of the Sacred Heart, wherein, above the altar, floats a banner with the legend, "Cœur de Jésus, sauve France!" A portal of similar character admits to the sacristy—a noble apartment thrown out from the third chapel in the south aisle, and around whose central vaulting pillar several processional crucifixes are disposed in sockets. Here are fine wainscotting and massively framed portraits of bishops and canons of Le Mans. The brazier for the incense stands down on the floor, and upon the tables the Eucharistic vestments of the colour proper for the day lie spread in readiness for the chapter Mass, which is performed here daily with much ritual and musical dignity.

A very interesting church at Le Mans is that of St. Julien des Près, situated on the opposite bank of the Sarthe, and only conspicuous by a small modern Romanesque western steeple, of so uninteresting a character that we walked nonchalantly towards it expecting to find the rest of the structure equally jejune. We were, however, agreeably surprised to find a cruciform apsidally-terminated church of fine proportions, and this pleasure was by no means diminished when we pushed open the door and were confronted by a noble arcade of isolated Romanesque columns and round arches, exhibiting quite a Durhamian air of "rocky solidity and indeterminate duration." The chancel is Pointed, and has a series of narrow stilted arches in its apse. All the eastern part of the building has received mural decoration, some frescoes above the bays in the triforium space illustrating the life of St. Julien being particularly telling. The situation of the altar in this church, beneath the eastern arch of the crossing at the top of a flight of steps, rendered necessary by the crypt beneath the eastern limb, imparts much dignity and interest to the interior. Behind the altar are arranged the choir stalls, as at Notre-Dame de la Couture, of which we shall speak presently. Above it is a suspended rood, one of the very few we remember ever to have met with in France. Figures of the Blessed Virgin and the Magdalene are seen regarding the rood from slender pillars, one on either side the sanctuary. The high altar, in very good Byzantine, has a tall central cross of the same style, and two blue vases of artificial flowers on a ledge in advance of the six flanking candles. Altogether this church wears a refreshingly Mediæval aspect, recalling very strongly in its ensemble the Rhenish Romanesque St. Cunibert's or St. Martin's at Cologne. But what we desiderate very strongly here, as everywhere in France, are rich hangings and an antependium. It is the presence of such needlework that gives our Anglican sanctuaries so rich an appearance. Evidently this church is in the hands of a curé who takes great interest in its history and architecture, as evinced by a printed history from his pen affixed to the nave piers at the west end above the bénitiers, and concluding with the following note:—"Il est défendu d'entrer dans l'église avec des chiens, avec des paniers, des pots à lait, ou avec tout autre objet qui indiquerait un manque de respect pour la Maison de Dieu."

(To be continued.)

THE POSITION OF ARCHITECTURE AMONG THE FINE ARTS.*

(Concluded from last week.)

THAT which places architecture above the sister arts is that while they, with few exceptions, of necessity record emotions and ideas of the past or present, architecture is, or should be, ever labouring to bring forth a new organic creation, something in sympathy with the needs, the developments, the aspirations of the time.

I want to emphasise this word "new" because the aim to be original is often spoken of as though it were a reproach. I am not defending wild and extravagant designs—though even they show life—but it is of the essence of vitality in art to depict that which has not been, to increase and multiply forms.

You will remember in Viollet-le-Duc's "Habitations of Man" there are two principles represented by Doxius and Epergos. Doxius who sees only in ancient architecture the *summum bonum* of art, and resents all change, who when he travels through the world for thousands of years is always with a sigh looking back to Egypt. This is the spirit of the rules of proportion, the worship of style, the negation of progress in science and art. Epergos, on the other hand, sees in the evolution and development and in the new offspring of architecture an evidence of godlike powers given to man, an evidence that life and not death is the keynote of the world, and he urges us on to strive, not stagnate.

If we approach an architectural design from the point of view of grasping the purposes for which the building is wanted, so planning it that its various parts adapt themselves to those purposes in such a way that all seems natural and harmonious; making the entrance-hall impressive and expressive with dignity, spaciousness and hospitality; arranging our windows so that the light shall suit the purposes of the various apartments, aerating with sunshine the various cubes so that sweetness pervades everything, breaking our large floor areas by columns, forming little surprises by arcaded recesses or galleries affording views of any particular picturesque groupings, and making all to grow naturally from our construction,

* A paper by Mr. E. T. Hall, read at the last meeting of the Architectural Association.

we may produce that which will be both artistic and individualistic, an evidence of thoughtfulness and of the creative faculty. I suggest this in opposition to Mr. Ruskin's or Mr. Fergusson's theories about a building pre-existing with the architecture added. I suggest that a good plan, well thought out on the lines I have roughly endeavoured to sketch, is a work of architecture, although the exterior may be absolutely plain—nay, even uninteresting.

If, however, the exterior is to be ornamental, this effect should not be attained by added ornament having no relation to the interior; but the decoration should harmonise with and suggest the interior and its occupants, just as in a work of sculpture the exterior of a figure suggests the internal framework—the well-developed muscles, the network of nerves, and, above all, the impulse which actuates them.

To attempt a work of architecture by first settling the exterior and then designing the plan and general interior to lead up to it is fatal.

As an illustration of the correct principle of design, let us consider the idea of a town hall. It is first the centre, the heart, of municipal life, whence all other parts of the municipality are governed. It should thus be placed in the centre of a town, in an open square or place. Its various departments—or, to use a conventional phrase, its cells—should be emphasised externally and internally.

The emotions pertaining to each should be considered and depicted, or rather suggested; the relative importance of each to the other should be weighed in locating them; the prison cells, the courts of law, the offices, the entrance and assembly halls, the suite of reception-rooms, &c.; simplicity of plan and easy access to the departments being essentials.

The physical proportions of each group should evolve from these considerations, and, in the mind of the architect, the exterior should grow *pari passu* with them, and should express each group and the unity of the whole.

The design of the exterior should also stamp with expression the mechanical functions of the several parts of the construction, and thus, as the various members of a human body are fitly joined together, the whole conception will convey to him who has eyes to see and mind to appreciate, the idea sought to be expressed.

In times not long past these principles were ignored and the exterior was designed, or rather copied, from a Classic temple—from a building which externally expressed faithfully the one cell which it contained, the abode of the god. Such an exterior has no relation to complex buildings of to-day. Or let us take at the other end of the scale the idea of a workman's small dwelling. My friend Dr. Godfrey Sykes, a well-known medical officer of health, remarked to me lately that the solution of the problem of housing the million should be regarded from the sanitary, social and ethical standpoints. Now the backbone and basis of our social polity in England is the home. The idea of a home is lost when a family is compelled to live in one room. What, then, is the idea of a home? Its central feature is the place of reunion of its various members—the living or common room—well lighted by windows and warmed by a stove or open fire. Where outlay must be restricted, we cannot waste money on passages, and there can be no objection to let the common room be a central hall, with bedrooms opening from it on two sides, the third side containing the scullery, water-closet, &c., disconnected by a ventilated lobby. Each bedroom should have a window and a ventilating flue, while the heat from the common room stove will be sufficient to warm the bedrooms, and so save both the cost of fireplaces and of fuel. Such a humble dwelling will be a home, and a congeries of such homes may be placed side by side in the country or one upon another in a town. In the latter case the staircase should, of course, be external to the houses. The æsthetic in such a dwelling as we have described can be expressed in simple ways, in little thoughtfulnesses of detail, in showing consideration for the housewife's wants and aspirations, making windows that will take flowers, in provisions for fostering modesty, &c.

In considering the expression of construction let us compare two types of buildings, and see the relation of construction to the design. Take a barrel-vaulted church. This vault, having an equal thrust at all parts of its bearing on the wall, demanded and received for its support a massive wall equal in thickness throughout its length, with relatively small openings. In such a case buttresses at any points would be out of place. By contrast, take a groined vault; here the weights and thrusts are concentrated on points, the wall between these points is but a screen, and can be light in treatment, and may be pierced with windows of any size. The points of support, however, require to be of large horizontal section, and buttresses become necessities evolved from the construction. Did time permit, we could trace how this groining and concentration of loads led to all the characteristic features of Gothic design. In Viollet-le-Duc's "Rational Building" we have the whole scheme worked out.

It has a peculiar bearing on the subject of our paper, because it shows how practically a new art development was laboriously worked out from construction.

It teaches us that "art is the result only of sober, cool, intelligent thought and technical knowledge, which is acquired by hard, persistent and long-continued labour," and further, that that labour evolved a result not otherwise to be attained.

M. le-Duc shows that practically the Romanesque builders had before them the remains of Roman vaulted buildings in their country and nothing else. They were not travelled men; they were too poor to import architects from abroad, and not having the command of unlimited labour and wealth like the Romans, they set their intellect to work to devise some means of getting similar results with home material and with home labour. Our author shows how, in the earlier part of the eleventh century, they built barrel-vaulted churches and halls which half a century later fell down; how, profiting by their failures, they again set to work with renewed energy and experience, and gradually, by slow but certain steps, evolved the Gothic groined vault; how this in turn led to the plans of piers; how the capital became a corbel instead of being, as it was in many Egyptian, Grecian and Roman buildings, not a support but only an ornamental termination to a column. This may be seen at Edfoo, where the abacus is of the same width as the diameter of the column, while the capital is projected far beyond it, or, in other examples, where instead of abacus there is a square shaft between the capital and the entablature; and again in the groined vaults of some of the Roman thermæ, where the plan of the vault abutment is a square of the same dimensions as the diameter of the column supporting it; above the capital and below the vault springing is placed the complete entablature of the Classic order.

In some churches, both in Normandy and in England, capitals are dispensed with, but this appears to give weakness to the design. A mark of separation between the function of the arch and that of the pier is of great phonetic value, and as such the capital or impost moulding has commended itself in the great majority of our buildings.

Reverting to the Gothic art-craftsmen, we note how they carried down their arch mouldings into shafts on the face of the reduced piers, and so step by step and line by line a new art development—a new architecture—grew out of and was determined by the construction which it boldly displayed. Gwilt says, "There is more constructive skill shown in Salisbury and others of our cathedrals than in all the works of the ancients put together."

It is not out of place to note in this connection that, while the Gothic shaft grew downward from the moulded arch, the shafts or fillets on the angles of Egyptian pillars grew from below and terminated in the non-functional capital.

We hear of taste in architecture, we hear of genius, but neither one nor the other could have dispensed with the more sterling and laborious qualities which evolved the new Gothic art—an art which has commanded and still commands the admiration of all who see its harvested fruits.

And here it is pertinent in parenthesis to remark on this much misused word taste. It is often spoken of as an intuitive gift, and many who arrogate to themselves its possession dogmatise on matters of art as though the appreciation and knowledge of art need no training whatever. Artists are not so easily made. Taste to be of any value or authority must be the outcome of wide observation, of judicial power of comparison and of education in its widest sense. And even then it is a variable standard which each sets up for himself, the result of his study or environment, and therefore in no way a standard of universal application. To a devotee of Classical architecture the proportions of a Classic column are in the best taste, while those of a Gothic shaft are barbarous, and *vice versâ*.

Of genius in architecture we may say, as Mr. Froude says of the gifts of strength, of wealth, of rank, of worldly power, "It is a splendid instrument if nobly used, but requiring qualities to use it nobler and better than itself."

The architects and craftsmen of our most beautiful Mediæval cathedrals evolved their masterpieces, as we have seen, by laborious study of the materials they had to deal with, of the forces exercised by their material employed in different ways; and the constructive features arising therefrom became the motive on which their design was based. The various phases and incidents of Christian worship and ritual then led to the general planning of their building; the nave, the aisles, the transepts, the chapels, the choir, the chancel, the sanctuary—all made subservient to or rather based on the Cross, the great emblem of their faith—and subsidiary to these, the chapter-house, the library, the offices, the cloisters, &c. In every part we see plan and construction emphasised as integral parts of the art expression. In them there is no room for talk of the work of the engineer and builder first and the clothing of architecture added to this. Architecture as a fine art is everywhere, and the art atmosphere pervades the building not only in architecture, but in painted walls, windows and roofs; in sculptured figures, traceries and canopies, in music, in stately processions of men, in waving banners, in adoring congrega-

tions—the whole having its main aim in rendering glory to the invisible God, a God whose majesty and mystery, as revealed by Christ, led to the soul's uplifting in a way that must have been unknown to the Greeks, whose gods were but deified mortals of whom their votaries could have had but a measurable appreciation.

These were days when art permeated the masses in dress, in pageantry, in village festivals, in guild processions. Be it remembered I speak of the period when the priesthood of the Christian Church were self-denying men, living in a chosen poverty, the teachers, the guides, the protectors of their flocks, drawing to them all that was good and great and generous in rich and poor alike, and before the great canker of worldliness, of wealth, of lust, of power, of intrigue and immorality had sapped their influence for good; before the Pope had in 1489 commissioned the Cardinal Archbishop Morton, his legate, to make inquisition into the charges made against the monasteries, resulting as it did in such a condemnation by the legate as justified beyond question the worst of the accusations. In the earlier times Gothic art was a power to raise men. In the degenerate days towards the early part of the sixteenth century it not only lost its power over men, but it came to stink in their nostrils as associated with the falsity of those who had been its leaders and patrons. And with this loss of faith in the Catholic Church, the cult of Gothic architecture as a living and growing art fell into a trance, and so remained for centuries. The moral shock not only brought about the Reformation, it chastened the laity, hardened their natures, made them puritanical. Their reverence of God was indeed intensified. The virility of the people asserted itself, and the horrors perpetrated in the Western hemisphere by the most Catholic Spanish nation sent such a thrill throughout England that no wonder the gentle and refining influence of architectural art was replaced by zeal and hatred against the system with which it was most closely related.

The energy of the nation was diverted. It became the instrument of Spain's destruction, and in fulfilment of that mission the great men of the Elizabethan era—Drake, Frobisher, Gilbert, Davis (whose name is perpetuated in Davis's Straits), Hawkins, Raleigh and many others—became the pioneers of that colonial empire of which to-day we see the development. The lives of these men are most interesting studies. That they were impressed with a firm belief that they were doing God's work is beyond question. They were human, and some of them blunt, unlettered men with faults grave enough, judged by our standards of to-day; but Froude, Charles Kingsley and Towle give us pictures of the purity of their lives, of their chivalry, their devotion to duty. It was in such an atmosphere and with these heroic surroundings that Shakespeare—as we are reminded by Froude—found living models for the finest and noblest of his dramatic characters; so that if art in one of its phases was banished, it in another blossomed in a way that has never been surpassed.

But while Shakespeare in immortal drama wrote of men and manners, of history and philosophy, architecture remained the history in stone of the past and passing ages, of the life of the nation from generation to generation. Take an old church, begun in the early centuires of our English civilisation, extended, varied; her gloomy interior of the earliest period opened up to light by large windows of a later period, modified in other respects from time to time; the rood-screen, once the line of demarkation between the clerical and the lay, now denuded of its titular ornaments, often removed from its normal position to enclose a side mortuary chapel or a secular lord's pew. Such a church tells us of the evolution of our history and race—whether upwards or in decadence—of sacerdotalism, of puritanism, of the autocratic king or the revolutionary rabble. The beautiful building, the emanation of man's aspiring soul, the offspring of his highest faculty—the creative—breathes of man's high mission, "its tenderness, its heroism, its regrets, its aspirations," as Oliver Wendell Holmes expresses it. Under her sheltering wing she takes his life during his short sojourn here; she hallows his birth, she blesses his marriage, she mourns his death, and she, raised from the earth by his behest, finally takes his earthly part into her reverent keeping.

What so grand as the interior of such a historical work as Westminster Abbey? Her architecture, itself marking epochs in the nation's life, scarred but not marred with monumental records of her sons' self-sacrifice to duty, of their energy, their learning, their great endeavour in all the paths of physical and mental activity. In what gallery of painting or of sculpture can such sublimity be found? Here the sculptor's art appears as handmaid to attend the sister art. Sculpture is most sublime when, as here, it seeks not its own glory but to minister to hers; when it adds the grave and chaste beauty, so peculiarly its own, to the solid qualities of her reposeful dignity.

But while this is true, it is also true that each of the arts has its separate identity, a personality as distinct and as responsible as that of any member of a human family. Each must work out her own salvation, aim for her own ideals, and in such aim she may, and too often does, loosen the ties which bind her to her sister arts.

Yet let us again insist that architecture is organic. Sculpture is a representation of the organic; painting is inorganic, illustrative only.

In architecture sculpture may be used as an organic part of the structure, as figures in a Gothic doorway or as the caryatides in a Classic temple, but in such relation it is an accessory to architecture, a blossom on the tree.

In a somewhat different category we may cite the sculpture on the Parthenon. This is organic, and I particularly wish to refer to the frieze. It has often been conjectured how this frieze came to be placed in the shadow close up to the cornice of the cella within the peristyle. It seems to me this stately procession in such a position, viewed from a short distance, broken up as it is by the columns, appears unending, mysterious, and perhaps was intended to be symbolical of the march of conscious life through all the ages.

Detached works of sculpture are best seen to advantage within or in juxtaposition to a building. Viewed with a natural background of foliage, dissociated from anything architectural, they appear lifeless; but on a background of man's architectural creation they become instinct with life; they are then like jewels of price on the neck of a fair woman, embellishing and embellished. I have referred to our Valhalla, but the Loggia de Lanzi of Florence will be recalled by all as another illustration.

A painted picture is different. It needs, it is true, to be housed, owing to its relatively perishable nature; but for its appreciation as a picture it demands exclusive attention, to be separated from its surroundings, the vision to be bounded by its frame, and the mind of the beholder to be detached from all else.

It is true that painting sometimes selects the position of handmaid to architecture when it is employed decoratively—it may be in a series of historical records locally appropriate to, and fitly forming part of the architectural monument it embellishes. In this case each picture has some harmony with its fellow pictures and with the sombre neutral hues of the stone. In such case painting becomes broader, more catholic. The same applies to painted windows. They form part of the architectural composition; they enrich and beautify it; their detail is there, inviting careful attention, but like the surface-carving on the exterior of a Venetian palace or the walls of a Gothic church, they are primarily the mosaic incrustation giving brilliancy to the whole structure.

Returning to our survey of Gothic architecture, we find that with the downfall of the monastic orders in England, and the continental upheaval brought about by Luther, with the revolt of the laity against the priesthood, Gothic church building ceased, and closely following on its cessation the army of Craft Freemasons was disbanded, or rather dissolved to atoms. The revolt was so complete that Gothic architecture in England was banned as associated with oppression and licentiousness—the virtue and self-abnegation of its artistic founders being forgotten.

Meantime, the revival of the study of Greek literature disclosed to the student as a new revelation a people free, untrammelled, heroic, artistic and godlike, the authors of pure and beautiful architecture, and cultured Europe turned to this fount for inspiration in all its art life.

In Italy, a demand for architectural monuments based on Classic lines found no school of architects at hand trained in the principles of their art, in the sense that the Gothic architects were trained.

The sculptors and painters who were called to design the new Renaissance buildings were not hampered by preconceived theories of design, or, indeed, by technical knowledge of old buildings, and although they sought to create, they were more anxious to build palaces which they might decorate than works of architecture. They built, it is true, large buildings, but in few of them is the art a natural outcome of the construction. Many are frankly but backgrounds for painting.

As an illustration, we may cite the Chapel of the Arena at Padua, painted by Giotto. It is a plain rectangular room having a painted waggon-vaulted ceiling with windows on one side, and not a moulding on the surface of walls or ceiling. As a work of the painter's art, the interior of the building is acknowledged as of the greatest beauty.

The Sistine Chapel at Rome was commenced 1473 and finished 1541, and Mr. Fergusson, in order to show the difference between the arts south and north of the Alps, makes a comparison between it and King's College Chapel at Cambridge, built at the same time, 1479-1530.

The Roman chapel externally was a barn, internally it was almost devoid of architectural mouldings or decoration. It was a barrel-vaulted ceiling, groined over the semicircular-headed windows at the sides. Its walls were covered with paintings by several artists. Its ceiling was painted by Michel Angelo, and later the wall over the altar was filled with his great work, *The Last Judgment.*

The Cambridge chapel, on the other hand, externally has a rhythmic division and a rich architectural treatment, while internally it is a web of architectural detail, all growing out of and expressing the construction. It has its pictures, but they are transparencies in glass.

The Sistine Chapel has been well and often described by able men, but if it has not already been noted I should venture to make a criticism in regard to its ceiling. This is a plain surface semicircular in section, divided into compartments by painted mouldings. As is well known, the central flat compartments from end to end are occupied with subjects ranging from the Creation to the Deluge, all illustrated with colossal figures. A spectator looking towards the altar sees the figures, it is true, in their proper or intended position, but seen from the altar end they are upside down and grotesque. Now had all these compartments instead of being flat been constructed as shallow domes, either circular or square on plan, no such defect could have been possible; all figures that could be seen from either end or from the sides would have appeared natural in a partially upright position on the concave surfaces, and would not have looked as if they would fall. None could have been seen upside down, and from the art side we should have had the idea that each of the subjects forming the decoration of the dome separately sent up its praise and adoration to the Most High.

In St. Paul's Cathedral Wren had evidently this aspiring idea in mind when he treated his ceilings with shallow domes throughout. In Sir W. Richmond's beautiful decorations of the choir we lose the painful impression of the Sistine Chapel, and do not feel that his figures will fall, while each compartment raises its pæan to heaven.

In St. Peter's, at Rome, there are domes in the aisles, but the nave is a long plain vault.

I do not propose to enter here into any comparison between St. Peter's and St. Paul's, except in so far as it relates to my subject, but in that relation I would remark that, if the Sistine Chapel ignores architecture, St. Peter's on the other hand misuses it. At least three designs were made for it, and the conception appears to have eventuated in the idea of obtaining a building with architectural features and details on a colossal scale, but instead of the resulting effect being a beautiful monument, the immense dimensions of which could at once be grasped, the mark has been overshot. All scale is lost. The Gothic cathedral architects kept their detail—their shafts and mouldings, and even their stones—small, and judged by the scale of these, their buildings looked very large, while it is stated as a fact that some of the largest are but of the dimensions of an aisle of St. Peter's.

Is it possible that this error arose from the fact that the glory of God was not the only or main object of the building, but rather the glory of the Pope, who wished to emphasise the majesty of his power among the nations?

In St. Paul's Wren avoided the error of colossal detail; his internal proportions became in consequence better, and there resulted a vista of imposing dimensions which the mind could grasp. The internal grouping, too, became more graceful; the double order, instead of the single one of St. Peter's, appears to lift up the roof; the domical compartments in the ceiling, to which I have already alluded, added to this effect, and led up to the great transeptal lantern and dome, the whole a conception of aspiring lines leading the eye and the soul ever upwards. Externally in almost every part it appears to be superior in grace of proportion.

Mr. Gilbert, R.A., recently at the R.I,B.A., spoke of Wren's cathedral as the work of a sculptor-architect, by which I think we understood him to mean one who in designing in architecture had the aptitude of the sculptor in proportioning his parts and modelling the whole building as it were out of a lump of clay, producing a result graceful and so to speak well poised from all points of view.

In speaking of this modelling of a building, it seems not inappropriate to say a word as to the picturesque in designing. Some few years ago we heard a great deal of this, and it was by some advocated as an end to be attained.

The picturesque in our Royal Courts of Justice is noticeable, but I doubt if it was sought for at all by its author. It was more likely to have arisen out of the natural expression of the constructive planning, and it certainly may be asserted that in most of our old domestic work it will be found to have had its origin in the planning, in additions from time to time to suit varying wants, in the opening up of prospects, or in other natural ways. Unless it has such a natural basis it is incongruous To distort an interior or exterior in order to get a picturesque is inadmissible.

Symmetry in a design, especially of a public building, is an element of great art value. Externally it contributes to the ideas of dignity and repose, and to that impressiveness due to simplicity. Internally a symmetrical plan is easy to follow, and the appreciation of the building is much enhanced if there is no irritation created in preoccupied minds by difficulty in finding one's way about. Mr. Aston Webb, at the Architectural Association, recently spoke ably on this subject. But symmetry does not mean cast-iron uniformity, or that everything is designed and set out with geometrical precision. The contrary is the case. The general effect is "ordered," so to speak; but Mr. Ruskin notes the variations in the width of piers and arches in the façades of numerous buildings which to the casual inartistic observer appear rigidly symmetrical. I will cite but the example of the Ca d'Oro Palace at Venice, where there is a battlement or cresting of varying height along the front. In the happiest way the architect has given the effect of symmetry, but on analysis it will be found that the effect is produced by an unsymmetrical outline. This is but one of the æsthetic refinements of architecture where the idea is expressed without demonstration.

In like manner, as I have endeavoured to show in the earlier part of this paper, proportion is not the result of following ingenious scales of modules framed on Classic examples, nor of triangles based on Gothic structures, but should be the æsthetic expression of the ability of the various parts of a structure to perform the duty imposed on them, the lower parts being necessarily more massive than the upper. It was probably a recognition of this which led Vitruvius to lay down a law that in superimposed orders the Tuscan or Roman Doric should be at the bottom, the Ionic next, and the Corinthian above that, because the first was the most massive, the last the lightest. But this arrangement gives us a cornice to the lowest storey larger and heavier than to the highest, whereas the function of a cornice to a roofed building is to throw the rain off the building, and to do this the cornice at the eaves should be larger, with more projection than any other horizontal feature of the façade, and æsthetically this arrangement is, as a rule, by far the best. Proportion must, in any living architecture, vary with the material used and with the size of the building.

The single order of the elevation of St. Peter's at Rome may be correct by scale, but it is unreasonable in its actual position. Again, we do not quarrel with the proportion of an iron column or stanchion at the Crystal Palace. It is seen to be appropriate to the material. The Eiffel Tower was formally protested against before its erection by a large number of eminent artists in France and elsewhere, but when erected these same artists recanted their former condemnation, admitting its grace and proportion, these being evolved from the perfect expression of the functions of the material employed.

The fact is, we should concern ourselves less with the proportion of any detailed feature in a composition than with that of the broader groupings of the whole structure. Detail is interesting and important, and should be sedulously studied when we come to it, but it is not the be all and end all. That which is seen of any monumental architectural work is the mass.

Mr. Walter Crane says that a people without art are, collectively speaking, inarticulate. In other words, if I may venture to interpret him, they may be scientific; they may, like Faust, sound the depths of knowledge, or, like Newton, soar to map the heavens; but unless they have minds to achieve and create, and the faculty to appreciate emotions and ideas, they are soulless—are of this earth and not a part of the immortal. Mr. Crane adds that the most vital art is the expression of character. If that be so, and if the noblest and most enduring quality of a race is character, then architecture, among the arts, is the noblest and most enduring—that which expresses the virility of a nation.

The formation of this quality of character is closely allied to religion. I cannot here enter into the philosophy of this alliance; but, accepting religion as a great agent, there can be no question that art is a potent influence in the teaching of religion. Science deals with demonstrable truth; art with imagination. Science tells us—very often on insufficient data, and, therefore, erroneously tells us—what is; and often will not admit anything to be which it cannot demonstrate. Art tells us that to live is the effort to be what life as defined by science is not; that if science makes anatomical sections of a man, maps his every nerve, and plans the channels of his life's stream, she has not found and cannot find the man, the living soul which art is ever disclosing in new forms. And as religion is the great exponent of the same message, she naturally draws to her this potent ally. From the earliest days it has been so, and hand in hand they have worked together. Architecture has raised the temple expressing the ideas which her co-workers expound.

Among the arts there need be no rivalry. Architecture can mould itself in sympathy with the sculptor, and can adapt itself to the exigencies of the painter. The more massive art can accommodate herself to the less robust arts and make provision for their display to the best advantage. So let it be.

What then are the practical conclusions to draw from our consideration of this most interesting subject? They are that the possibilities of our art are great, that the responsibilities of its exponents are greater. We have cause for much rejoicing that this wonderful century is closing with bright prospects for architecture. It is more zealously and lovingly studied and expounded. Its spirit is more appreciated, not only by its

ministers, but by a growing number of the public. This should rouse our enthusiasm, but although enthusiasm is good, let it not carry us away to false ideals. Avoid the cant which suggests that it is beneath an artist architect's dignity to pursue the humbler details of his studies, the scientific basis for his perfected work. Enthusiasm should spur us to labour and to study. In itself it will attain nothing. Enthusiasm for music, and a nervous horror of discord, will not enable us to compose or to perform music, nor will a similar emotion make us architects.

For us to carry the banner of our art still upward and onward needs a power to apprehend current needs, logical reasoning, much labour, courage, and technical study, as well as the environment of art works, of liberal thoughts, high ideals and aspirations, and sympathy. We must throw off the shackles of past civilisations, not ignoring but assimilating all that they can teach us, and steadily seek to create and express what is best and brightest for our own time.

In this way the position of architecture among the arts will be a high and noble one, and with its sisters, sculpture and painting, it will beautify and ennoble the people's life, and so reverse the oft-repeated but we would fain hope untrue dictum that art flourishes best in the decadence of a nation.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Association was held on the 14th inst. in the Royal Institution, Princes Street, Mr. Thomas Ross, the president, occupying the chair. The chairman referred feelingly to the death of Mr. Hamilton Beattie, and proposed that a letter of condolence should be sent to the family of the deceased member, and this was agreed to. Mr. Edwin Forbes then delivered a lecture on a year's work in Galloway in connection with the School of Applied Art Studentship which had been gained by him. After stating that it was scarcely possible to over-estimate the boon which the School of Applied Art was to those who had chosen architecture as their lifework, he proceeded to describe Dundrennan Abbey, Glenluce Abbey, Lincluden College, Sweetheart Abbey and Caerlaverock Castle, giving history, traditions and dates in connection with each of these buildings. The lecture was illustrated with limelight views.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.

A SERIES of most instructive visits have just been paid on Saturday afternoons by the students of the architecture and building construction department of this College. The structures visited in course of erection were Ruchill Hospital, Pollokshaws Town Hall and Glasgow Bridge. One afternoon was spent at the sewage purification works; another at the cathedral, when Professor Gourlay conducted a special architectural class visit for the study of the vaulting; while on a third the honours stage students joined the Craftsmen's Society on a visit to the weir, now being constructed on the Clyde. All these visits were very largely attended by the students.

The Scotch Education Department have awarded four Queen's prizes, value 2*l.* each, to students of the architectural department of the College, namely, one in architectural design to James M. Alexander, and one in architecture to John M. Arthur; and two in building construction, the one to James A. Ferguson and the other to Robert Park. These prizes are awarded to those students who do best in the May examinations, and they are competed for by students in all parts of the United Kingdom.

AN IMMERSION FONT.

ON Sunday morning a font grave for baptizing adults by immersion was dedicated as a memorial to Archbishop Benson in the parish church of Lambeth. The new font is in the baptistery immediately behind the one in ordinary use, and is designed after the general plan of one in the ruined church of St. Stephen in the Campagna at Rome. It consists of two concentric semicircles with steps down on each side. The material used is Pavonazzo marble, with a kerbing of Languedoc marble. On an iron rail between the old and new font is an inscription in open copper-work, taken from the font at Sta Sophia at Constantinople, which reads both ways—ΝΙΨΟΝ ΑΝΟΜΗΜΑ ΜΗ ΜΟΝΑΝ ΟΨΙΝ. The rector had talked over the idea which has thus taken place with the late archbishop before his death, and it received his general approval. There is no church in London in which baptism can conveniently be administered by immersion, and the rector will always be ready to lend the baptistery to any clergyman who desires to use this primitive method of administering this sacrament. The work has been executed by Messrs. Farmer & Brindley from designs prepared by Mr. J. Arthur Reeve, of Victoria Street, Westminster.

TESSERÆ.

Homeric Greece.

THE Greek cities of Homer's day, like the towns of the earlier part of the feudal period, could not have been very populous places; probably not one yet numbered more than 3,000 or 4,000 souls. The chieftain lived on his own domain, which he had acquired himself or received by inheritance, or which had been more or less voluntarily bestowed on him by the people, for this was the only way in which, besides that of occasional gifts, they could requite him for his public services. Neither rent nor tribute appears to have been established, or even understood. Money was unknown. A chief, in estimating his wealth, only considered how long what he had would maintain his establishment. The general community was composed of small freeholders, who lived upon their little estates. Their land was in as complete a sense theirs as the chieftain's was his. The chieftain's dignity had three supports: his superior wealth, his having the chief, and generally the sole command in war, and in effect the administration of justice; but, after all, it was his high personal qualifications which enabled him to maintain his position. War was almost the normal state of society; and predatory excursions, which were war under another name, might at any moment be entered on or have to be resisted. This obliged each little community to have at its head one who possessed the power of levying at any instant the freemen of the district and could command them in the field. They must have a man in this position, for the people were, as we may say, always under arms, and the one indispensable daily function of government was to provide against and repel warlike attacks. These petty chiefs were spread over the whole country—every district had its own. Slavery, but in a mild form, was customary, the men being chiefly employed in agricultural, the women in domestic occupations; in a chieftain's house we find even the cellar in charge of a female. A few of the most necessary of the useful arts were practised; for instance, we find occasional mention of persons who were acquainted with the healing art. This, however, had not yet given rise to a profession. The notices of the business of the merchant are as slight; because in times when wants were few, money unknown, little security at home and none upon the sea, such a class could not have maintained itself.

Gower's Monument in Southwark.

A quiet spot was the church of St. Mary Overy's, Southwark, long after Gower's suppliant effigy was set up in its side chapel; for although even then the currents of business and population ran over London Bridge, yet the silent highway of the river was the principal thoroughfare of the City; meadows sloped down to the Thames, cattle grazed in Lambeth Marsh, and where the terminus now stands, with its perpetual hubbub and haste of arrivals and departures, were fields and gardens, through which ran the broad road that Chaucer's pilgrims followed, and which knit into one stem the various branches of the great highways that led to Dover, to Hastings and the shrine of St. Thomas at Canterbury. Unconsciously, Gower had taken for his last earthly resting-place a spot destined to become as turbulent as the "still-vext Bermoothes." Yet to this corner of unquiet, no less than to Chaucer's more secluded monument in the Abbey of Westminster, will occasionally resort a pilgrim to whom the memory of one of the founders of our language is dear. For those who have not yet made this pilgrimage, or may not have Dr. Pauli's volumes at hand, it may be interesting to transcribe such earlier descriptions of this altar-tomb as it appeared before the pious churchwardens of 1764 "repaired and beautified," as none but churchwardens can, this venerable monument. Blore, who saw it after it had been twice "beautified," thus described the tomb:—"The monument of John Gower is in the chapel of St. John, in the north aisle of the nave of St. Mary Overy's, commonly called St. Saviour's Church, in Southwark. It is entirely of stone, and consists of a canopy of three arches with bouquet (crocketed) pediments parted by finials, and at the back of each pediment three niches, of which there are also seven in front of the altar-tomb." Berthelette, who saw the monument in or before 1532, ere a churchwarden had "improved" it, since he mentions it in the introduction to his edition of the "Confessio Amantis," published in that year, thus describes the figures—now nearly obliterated—of charity, mercy and pity, which were painted against the wall within the three upper arches:—"Beside on the wall where he lieth, there be peinted three virgins, with crownes on their heades, one of the which is written Charitie, and she holdeth this divise in hir hande:—'En toy qui est filz de dieu le pere sauve soit qui gist souz cest pierre.' The second is written Mercie, which holdeth in hir hande this divise:—O

bon Jesu fait ta mercie al alme, dont le corpe gist icy.' The third of them is written Pitee, which holdeth in hir hande this divise followynge :—'Pour ta Pite Jesu regarde et met cest alme en sauve garde.'" On the top of the altar-tomb is the effigy of the poet—a portrait statue dimly shadowing the original. The hair falls in large curls on his shoulders, and is crowned with a chaplet of four roses, originally, as Leland tells us, intermixed with ivy, "in token," says Berthelette, "that he in his life daies flourished freshely in literature and science." It is inscribed *ihi merci.* A long robe, closely buttoned down the front, extends from the neck to the feet, which are entirely covered. A collar of SS, from which is suspended a small swan chained, the badge of Henry IV., hangs from his neck; his feet rest upon a lion, and above, within a panel of the side of the canopy, a shield is suspended charged with his arms. On the ledge of the tomb was an inscription, now entirely gone :—"Hic jacet J. Gower, arm. ang. poeta celeberrimus ac huic sacro edificio benefac. insignis vixit temporibus Ed. III. et R. II."

Treatment of Gardens.

A garden when perfect should give the idea of a highly-favoured spot in the landscape whose soil is more prolific and better tended, whose flowers and fruits are of a superior kind. The enclosure should make the greatest possible contrast with the rude scene without. This contrast is heightened when the situation of the garden presents views of scenery much at variance with its own peculiarly rich, soft and orderly appearance. The gardens of the Villa Albani and of others to the east of Rome are, in this way, very advantageously placed; from their highly ornamented terraces one sees the desolate, wild Campagna with its dreary ruins, backed by the distant Apennines. The absence of mountains round London weakens much its scenery, but no part of it is more straitened by the effect of this deficiency than its gardens, for which the landscape is too soft. On this account, extraordinary care, cultivation and ornament are required to give them their necessary characteristic distinction. Besides the accelerated and orderly growth, and careful training and pruning of plants and trimming of borders, other adventitious means, such as work in marble or stone, should be freely resorted to, and that work always fine. Balustrades, with their continuous line, emerging here and there from among the shrubs, terraces and stairs, piers crowned with statues or vases, jets-d'eau, all heighten the artificial characteristic look of a garden. The statues in a garden should be white or fair; being important, costly objects, they should be by colour made remarkable; bronze is ineffective. Conservatories and greenhouses should be much ornamented, gilding should always appear; they should besides show on some part carving on stone or masonry, in order to connect their appearance with that of the balustrades and statues; the seats in a garden whch are seen should be of stone or marble. Summer-houses and alcoves should always be of stone or marble; the style which appears best suited to them is the pure Ionic; in the Corinthian the affectation of foliage is objectionable, a comparison might lightly occur between the beautiful original and this poor copy; for the same reason the Gothic styles are not good. Care should be taken that the appearance made by these retreats in no wise interferes with the importance of the villa to whose grounds they belong.

The Ear of Dionysius.

At a short distance from Syracuse in one of the quarries is the Ear of Dionysius. A beautiful garden has to be passed through in going to it from the first of the caverns. The Ear is probably the most wonderful acoustic contrivance in existence, and that it was the work of studious design is proved by a second one commenced in a neighbouring quarry—commenced, but not further prosecuted, evidently because it would not answer, from the soft, chalky material of the wall on one side. The external shape of the conch is that of the ass's ear. The aperture, through which the light now enters from its further end, and from a height of 120 feet, was till lately not known to exist, it not being supposed that the ear had any meatus internus corresponding with the external one. The accidental removal of a quantity of loose stones from above revealed a narrow passage of from 20 to 30 feet in length, and opening directly into the cave. This internal opening is situated almost immediately over the amphitheatre 120 feet above the floor of the cavern, and (measuring in a plane) is 180 feet from the external opening. Having rent paper, which made an incredible noise, and let off a Waterloo cracker, which reverberated along the walls like thunder, and done other deeds of the same kind below, we ascended, and walking over the back of the cavern presently came upon the passage which leads to its inner opening; and there, leaning over a parapet wall (in doing which we almost exclude the feeble light that penetrates into the cavern from behind), we are startled by a very audible but faint whisper, which comes from our friend below, asking us to declare our present sensations. We reply in the same faint whisper, and are immediately apprised of its safe arrival by another. One hundred and eighty feet separate the parties. In the stillness of that half-lit cavern not only were our faintest whisperings conveyed, but we could hear each other breathe.

The Hague.

The antiquities of The Hague lie about the Binnenhof and Buitenhof, or inner and outer courts. In the former, where the good old Barneveldt was beheaded, is the most remarkable building of the city, the Hoog Geregtshof, or High Criminal Court, an instance of that sparingly ornamented, solid, brown architecture, like Gothic reared on beer, which prevails more or less all over Holland. The Groote Kerk is another specimen with ecclesiastical differences, and a slight infusion of the pagoda. In fact, walking through a Dutch city after the old towns of Belgium is like drinking brown stout after burgundy. Both buildings and paintings are undeniably solid and honest and wholesome; you have nothing to complain of as far as they go, no crudeness or want of finish. But somehow they have a kind of drowsy effect after the bright rich fancies of the Ghent and Antwerp architects, and of the Hemling, Van Eyck and Matsys pictures. Strange that it should be so. There can be no great difference as to race between Holland and the part of Belgium which is richest in art; in the physical character of the country there is none whatever. Nor were they differently circumstanced when, for example, yonder opaque edifice and the spire of Antwerp were built. There must be something subtler than we wot of to account for this, and whatever it is it also probably accounts for Utrecht and the Seven United Provinces, and Admirals Van Tromp, De Ruyter and De Witt, and Dutch colonies and Protestantism, and Flemish Catholicity and manufactures. Can it be that the truth lies at the bottom of those silent canals? That which helped the country to expel the Spaniards may have also helped to make it self-reliant, self-confident, and at the same time less likely to be affected by foreign influences.

GENERAL.

In Consequence of the sudden death of Mr. J. Gibbons Sankey, M.A., F.R.I.B.A., of 104 King Street, Manchester, who has carried on an extensive practice as an architect in Manchester and London, and for whom Mr. John Cubbon has acted for some years as manager, an arrangement has been made by which the practice has been entirely assigned to Mr. Thomas W. Cubbon, of Birkenhead, and his brother Mr. John Cubbon, Associate-elect R.I.B.A., who will continue the practice under the name of Messrs. Sankey, Cubbon & Cubbon. Mr. Thomas W. Cubbon will continue to reside in Birkenhead, and practise in Birkenhead and district independently of the Manchester firm.

The Next Ordinary General Meeting of the Surveyors' Institution will be held on Monday, January 9, 1899, when the adjourned discussion on the paper read by Mr. Wm. Weaver (Fellow) at the last meeting, entitled, "The London Building Act and the Official Supervision of Buildings," will be resumed. The chair will be taken at eight o'clock.

M. Ferdinand Cormon has been elected a member of the French Academy of Fine Arts, in succession to the late M. Lenepveu. The style of the new Academician can be judged from the illustrations of his *Family of Cain* and *Return from the Chase* published in *The Architect.*

The London County Council have requested Mr. Thomas Blashill to remain in his office of superintending architect for a few months until an eligible successor can be discovered.

The Tapestry Panel which was purchased at the sale of the Eudel collection for 27,000 francs has been framed, and is exhibited in the Edinburgh Museum of Science and Art. The subject is the Triumph of Prudence, and the panel measures 17 feet by 13 feet.

The Reports of the summer excursions to places of interest by members of the Upper Norwood Athenæum have been published by Messrs. Truelove & Bray. The record is edited by Messrs. Stanley and Harradence, and will have much interest for lovers of suburban archæology.

Messrs. Hudson & Kearns have brought out their excellent series of diaries and blotting-pads for 1899. Every one who has used those equipments for office work during a year will be ready to testify to their convenience, comfort and endurance. They are most efficient aids to the expediting of business.

The David Salomons Scholarship for 1899 has been awarded by the Institution of Electrical Engineers to T. R. Renfree, student in the Siemens Engineering Laboratory of King's College.

The Parish Church of Bradford is to be restored partly as a memorial of the late Archdeacon Bardsley. The cost is estimated at 10,000*l.*, and the subscriptions received or promised already amount to 5,740*l.*

Professor Jebb has been appointed Professor of Ancient History to the Royal Academy.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BRADFORD.—Jan. 2.—Designs are invited for erection of a central fire-brigade station. Three premiums are offered, viz. 100*l.*, 50*l.* and 30*l.* Mr. George McGuire, town clerk, Bradford.

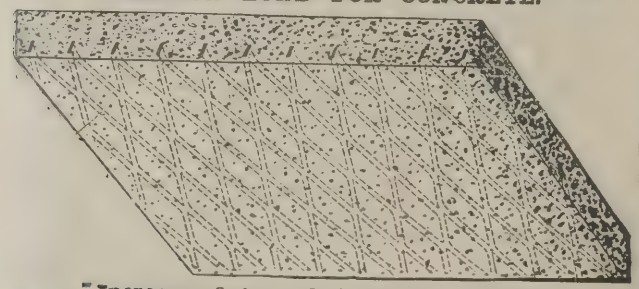
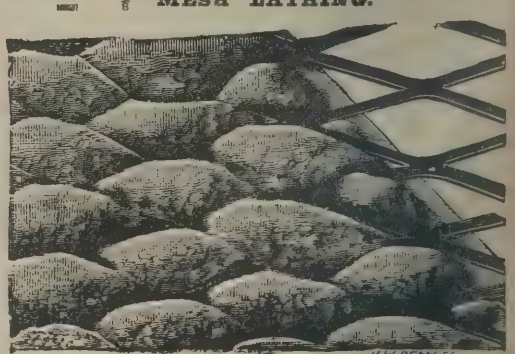
MESSRS. G. M. RESTELL & SON, of Soho Pool Wharf, Birmingham, are sending out a neat little pamphlet descriptive of their fireproof Adamantine shell plaster and their metallic Albino cement for walls, ceilings, &c. Among the advantages claimed for the fireproof Adamantine are the following:—It can be used in frosty weather; it will set hard in an hour, and has a smooth and marble-like face; it is fireproof and damp-resisting; can be papered or painted on in a few hours, and can be stained throughout almost any colour.

ENGLISH MOSAICS.

ONE of the largest workers in mosaics in the northern counties of England is Mr. George Swift, the Temple, Dale Street, Liverpool, who for the past sixteen years has been employing a number of mosaic workers in preparing mosaics of all kinds—glass, marble and ceramic. He has executed much important mosaic work in Liverpool, and has a large connection not only over England but as far as South Africa. For the last few weeks he has been engaged on a fine ceramic mosaic pavement for the banking-room of the Bank of Africa at Johannesburg. This important contract was secured after competition with the leading firms in this country.





The work consists in covering the whole of the public space—about 250 square yards—and all the entrances and vestibules connected with the building. The designs, which are elaborate, are in the Italian Renaissance style, freely treated throughout, the entrance vestibule being the most ornate, having the name of bank worked in among some very florid scroll-work.

The mosaic has been shipped this week for Johannesburg, and Mr. Swift's own experienced men are going out to do the fixing, so that nothing will be wanting to make the work a success. The architect is Mr. W. H. Stuck, A.R.I.B.A. Although Mr. Swift makes a specialty of mosaic work he executes commissions for every kind of faïence decoration. We understand he is just now completing large contracts in Liverpool at the Town Hall, the Arcade, Cook Street, the Edinburgh Life Assurance Building, the Stock Exchange, the Bank of Liverpool, &c. Mr. Swift's practical knowledge and experience insure the success of all the work he undertakes, and as he employs a large band of experienced fixers he can execute his work with despatch. His patent dovetailed back tile has been one of his great successes. Tiles made with this security at the back when once fixed to the walls cannot again become loose, a very important matter in connection with decoration of a permanent character.

ASBESTIC PLASTER.

THIS valuable material, which is manufactured by the Asbestos and Asbestic Company, of 27 Billiter Buildings, E.C., is being used throughout the new Carlton Hotel, which is in course of erection at the corner of the Haymarket and Pall Mall. Some time ago we called attention to the merits of this plaster, and a visit to and inspection of the work at the Carlton has but

MEDALLISTS, ROYAL PHOTOGRAPHIC SOCIETY, 1895—97,
ARCHITECTURAL PHOTOGRAPHERS,
77 OXFORD STREET, W.
PRICE LIST AND ESTIMATES ON APPLICATION

served to confirm our belief in those merits. The plaster is not only in itself absolutely fireproof, but is a perfect non-conductor of heat; it is an equally effective non-conductor of sound, and should thus seem to be peculiarly adapted to hotel work; it will not stain, being impervious to the action of water as to that of heat, while it is at once solid and yet elastic.

Architects and artistic decorators will, however, be chiefly interested in the fact that asbestic plaster not only sets readily, but when set forms an excellent surface, and as neither hair nor any other fibre is used, immunity from insects is secured. Moreover, the plaster can be finished either smooth or in any degree of stippling as may be desired, and thus lends itself either to delicacy of outline or to the broader and less detailed treatment which now enjoys a good deal of favour.

It is perhaps hardly necessary to mention that asbestic plaster can be finished to receive paper or any other kind of applied mural decoration. But whatever may be the kind of decoration, either to walls or ceilings, asbestic plaster will receive and retain it. Our readers might usefully visit and inspect the plastering which is being executed at the Carlton Hotel.

READING MASTER BUILDERS' ASSOCIATION.

AN important meeting of the master builders of Reading and the neighbourhood was held at the Queen's Hall, Reading, on Thursday evening, the 8th inst. Mr. James Catley presided, and the attendance numbered over one hundred. The meeting was held as a sort of preventive to the recurrence of such strikes as that which has recently occurred among the builders' employés in Reading. It was organised by a committee consisting of Messrs. Catley, Bottrill, Lewis and E. B. Badcock. It was felt to be the interest of master builders that an association should be formed in Reading to federate with similar organisations in London and the provinces. This object was accomplished at the meeting, which was addressed by Mr. Thomas F. Rider, ex-president of the London Master Builders' Association. Mr. E. B. Badcock moved:—"That it is desirable to form a Master Builders' Association, with the object of promoting and protecting the interests of the building trades of the district, and that this meeting hereby pledges itself to protect such an Association." The motion was seconded by Mr. Musselwhite (Basingstoke) and carried unanimously. Subsequently a committee of twelve members was appointed to draft rules for the Association.

THE STRENGTH OF CRANE SCAFFOLDING.

AT the second ordinary meeting of the Royal Society of Edinburgh, Lord Kelvin presiding, Mr. R. G. Alford, M.Inst.C.E., delivered a paper entitled "Crane Scaffoldings; their Mathematical Calculation and Probable Theoretical Deficiencies." He based his calculations on two scaffoldings at the Royal Infirmary, Edinburgh, and the Waverley Station, Edinburgh, the latter of which was blown down on March 18 last. He described the construction of the two, and deduced certain rules which mathematical conditions seemed to imply as a necessity for safety. He dwelt on the supreme importance of effective combination of the towers. As to the Waverley Station structure, he suggested that theoretically it should have stood. He made three suggestions to contractors. When there were towers they should adopt the strict equilateral triangle form, and so be prepared for any direction of the wind. They should never omit deep bracing girders between the towers half-way up, and when they did not stand on the ground their feet should be connected in a similar manner. The towers ought also to be filled up with stones or bricks at each leg, to add stability to the feet. In reply to the discussion which followed his paper, Mr. Alford said that in the case of the Waverley Station accident it was a matter of weight against wind. Had the scaffolding been overturned by too much weight being put upon it his conclusions would have been different. In answer to Lord Kelvin, he said he thought the greater weight of the legs would have prevented an accident. Several other communications were made.

THE N.A.P. Window Company, Limited, 159 Victoria Street, announce that, notwithstanding the general rise of 5 per cent. in the brassfoundry and allied trades, all orders received before January 12, 1899, will be accepted for future delivery at the catalogue prices without increase. On and after January 12, 1899, however, the prices in the N.A.P. catalogue, with some exceptions, will be subject to an increase of 5 per cent.

TRADE NOTES.

THE Convalescent Home, Barnhill, near Dundee, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides and with descending smoke flues.

THE Great Central Hotel, Marylebone, which is now nearly completed, is being fitted up with Merryweather's "Hatfield" noiseless pumping engines for domestic water supplies throughout the building. These machines are altogether different from any class of pump hitherto erected in hotels, and have the advantage of being absolutely noiseless. Any hotel resident who has been annoyed by the throbbing of ordinary pumps will greatly appreciate this new installation. There are many hotels where the pump machinery can be heard on every floor, and more especially in those built on so-called fireproof principles, the walls acting as a sound conductor and carrying each throb of the pump throughout the rooms above. The "Hatfield" pumps are also fixed at St. James's Hall, Lord Rothschild's house in Piccadilly, Hatfield House and other well-known mansions.

ELECTRIC NOTES.

OWING to a temporary interruption of the electric current, through a flaw in the original cable, some churches in the centre of Manchester were greatly inconvenienced on Sunday evening. At St. Anne's the service could not be held. The cable which broke down is being replaced by a new one.

THE Whitechapel District Board have appointed Mr. Wright, electrical engineer to the Brighton Corporation, for five years, at a salary of 600*l.* per annum, to carry out the electric lighting of the Whitechapel district.

AT a special meeting the Runcorn Urban District Council resolved to memorialise the Board of Trade for a provisional order under the Electric Lighting Acts to supply Runcorn with electrical energy, and the secretary was instructed to forward the customary fee of 50*l.* Councillor Bisbrown said the Council had been compelled to take this step by the action of outside electrical companies.

THE purchase of the Yorkshire House-to-House Electricity Company's undertaking by the Leeds Corporation has been completed, and the company's works and premises have been formally handed over to Councillor J. Green Hirst, deputy-chairman of the lighting committee, on behalf of the Corporation. The total amount of purchase money paid by the Corporation to the company was 222,987*l.* 18*s.*

AN inquest was held on the 20th inst. at Southampton on the body of William Day, electric jointer, in the employ of Messrs. Grover & Co., Manchester, contractors for laying the electric mains for the Southampton Corporation. Deceased was called on to repair a joint in a high-tension cable. He had no gloves, and accidentally touching the exposed part of the main the current passed through his body. He screamed, but died almost instantly from shock. The jury returned a verdict of "Accidentally killed," and recommended that gloves should be used in future.

A SPECIAL meeting of the Glasgow Town Council was held on the 19th inst. to consider a draft agreement between the Glasgow Corporation and the Partick Burgh Commissioners for the transfer to the Corporation of the Partick Electric Lighting Order of 1893. The clauses of the agreement provided that the Corporation should pay the costs incurred in obtaining the order and in opposing an application being made by the Kelvinside Electricity Company; that the prices charged to private consumers should be similar to those within the city, and that the charge for street lighting be subject to agreement between the two authorities.

THE shareholders in the Sheffield Electric Light and Power Company, Limited, met on the 20th inst. to complete the arrangements for handing over the concern to the Corporation. Under the special Act of Parliament the Corporation undertook to buy up the company on the basis of 220*l.* of Two-and-a-Half per Cent. Redeemable stock for every 100*l.* of capital properly expended by the company, or as an alternative 213*l.* 8*s.* in cash for each 100*l.* The chairman of the company (Alderman Franklin) explained that as municipal securities had

been deteriorating in the markets the directors had no difficulty in deciding to take the purchase price in cash, and it would be paid on the 31st inst. He estimated that for every 7*l.* share the holders will receive from 17*l.* 10*s.* to 18*l.*, with the addition of a 10 per cent. dividend on the past year's working.

BUILDING AND BUILDERS.

PLANS have been passed for the erection of a new parish church at Hetton-le-Hole, Durham.

THE Wesleyan chapel at Norton, Malton, has been re-opened, after being closed since May for enlargement. The cost of the alterations, including the removal and improvement of the organ, is about 400*l.*

THE restoration of the ancient and interesting church of Holy Trinity, Hull, will shortly be begun, and it is hoped that when the restoration of the interior is accomplished the Hull citizens will turn their attention to the exterior of the building.

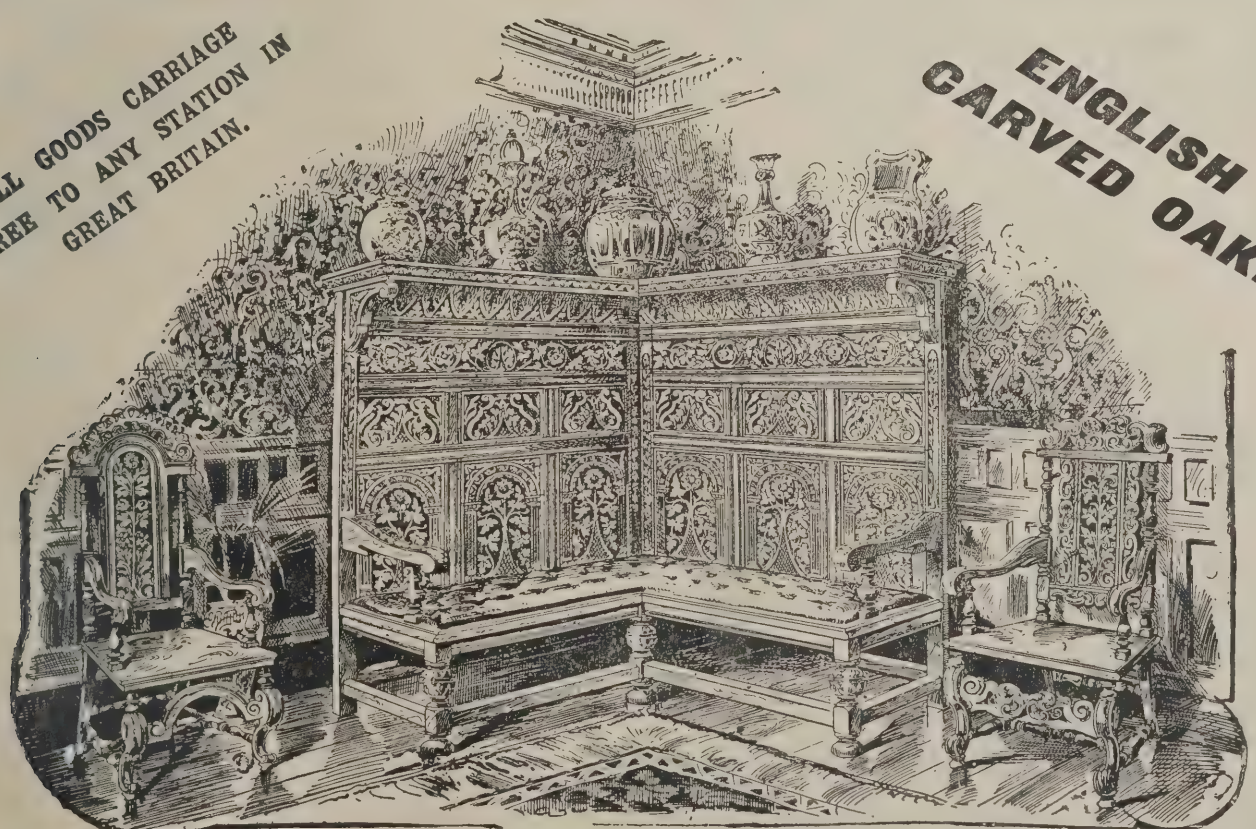
JAMES MURRAY, a joiner, residing at Ravelston Cottages, Edinburgh, has been admitted to the Edinburgh Royal Infirmary suffering from severe injuries, caused by his having fallen from a height of two storeys at a new building in Murrayfield.

THE Nelson Wesleyan circuit has decided to erect a chapel, to cost about 4,000*l.*, in Cooper Street; a school chapel, to cost about 2,000*l.*, at Bradley Hall; and a school chapel, to cost about 2,000*l.*, in Temple Street—in each case the amount to be expended to include the cost of the site.

SKELMERSDALE old church has been closed for some time, colliery operations having made it dangerous, and at present church work is being carried on in the parish under considerable difficulties. Plans are, however, being prepared by Mr. Bradbury, the diocesan surveyor, for an edifice to accommodate about 500 persons. The proposed site is one of the vicarage fields, and the cost is estimated at 5,000*l.*

IN consequence of the increasing rents and the additional difficulty of the working classes to obtain houses in the East End, the Bow Vestry has passed a resolution calling on the London County Council to acquire the Grove Hall site, Bow, on which to erect workmen's dwellings. It is estimated that over 1,000 persons could be housed on the site and provision made for a small recreation-ground.

AT a special meeting of the Rugby Urban Council the Clerk read a letter from the Local Government Board sanctioning the borrowing of an additional 3,000*l.*, being 2,500*l.* to add to the 4,000*l.* left by Mr. Benn for building purposes and 500*l.* for furnishing the proposed municipal offices. The Council formally decided to proceed with the work, and the plans committee were asked to take the necessary steps towards the pulling-down and clearing away of the existing building. A hope was expressed that the municipal buildings would be commenced early in March.



AT a meeting of the statute labour committee of the Glasgow Corporation held on the 16th inst, it was agreed by thirteen votes to two to recommend that two bridges be erected across the Clyde east of the Albert Bridge, one for cart traffic at Govan Street, and another for pedestrians only at Polmadie Road. The two bridges are estimated to cost about 8,000*l.*, and are to be constructed out of the materials of the temporary wooden bridge at Jamaica Street.

A SPECIAL meeting of the Edinburgh School Board was held last week for the purpose of considering a motion by Mr. Ferrier remitting to the building committee to instruct the architect to prepare plans for the erection of school buildings on the sites which have been purchased at Comely Bank and Parson's Green, and also on the site belonging to the Board at New Street with the additional ground which has been acquired there and to report. Mr. Ferrier, in submitting his motion, said the Education Department insisted that they had no right at any time to overcrowd any one roll. In thirteen schools the average roll was in excess of the accommodation to the extent of 909 places. He proceeded to show that the number of places in the various schools was 33,451, while the number on the average roll was 32,825, giving a surplus of places of 625, or an average of twenty places in each of the thirty schools in the city. Dr. Mackay seconded. It was agreed to consider the three schools separately. After discussion, it was resolved to erect schools at Comely Bank and Parson's Green. There was an equal division on the question of the proposed addition to North Canongate school, and, as the chairman did not exercise his casting vote, the matter was allowed to drop.

A MEETING of the Bradford Corporation Cartwright Memorial Hall committee was held on the 15th inst. at which Mr. A. Waterhouse, R.A., attended to advise in the drawing up of conditions in regard to the competitive plans, &c., for the new hall. After a lengthened sitting the committee adopted conditions,

Estate Department.—Auctions and Private Sales, Valuations, Lettings, Surveys, Repairs, and Decorations

ordered them to be printed, directed that a sketch plan of the site be prepared, and that advertisements be issued inviting architects to send in competitive plans. The new building is to cost 38,000*l.*, and this sum, with the 2,000*l.* architect's commission, will make up the total amount given by Lord Masham. Three prizes of 150*l.*, 100*l.* and 50*l.* are to be given for the three best plans. The new hall is to be erected of the finest stone in the Classical or Renaissance style, with a main frontage to the principal entrance to the park. It is to include a basement for storage purposes, a work-room, a refreshment-room, a public lavatory and shelter accommodation. The ground floor, which is to have a front and side entrance, will comprise a large central hall, lighted from the roof, and rooms for caretakers, officers, &c., and a museum. The first floor is to comprise a suite of rooms, extending along the entire front, which, on the occasion of important civic functions, may be used as entertaining-rooms. They will include a mayor's parlour or drawing-room, a reception, ball and banqueting hall. The whole will be so arranged that they can be used as art galleries, or so that the whole can be converted into one large room. April 14 has been fixed by the committee as the latest date on which designs may be sent in.

VARIETIES.

The benediction of the crosses on the new church at Bishopthorpe, near York, took place on the 15th inst. in the presence of a fairly large attendance of parishioners and neighbouring clergy.

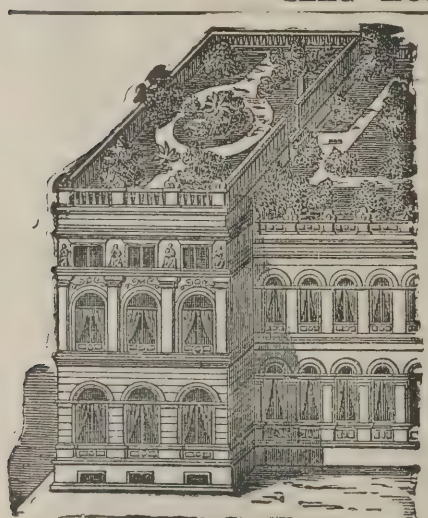
It appears after all that the rumoured postponement of the Paris Exhibition was unfounded, and that it will be at least as nearly complete as usual by the date originally named for the opening in 1900.

A new and commodious theatre has been erected at Luton, from the designs and under the superintendence of Mr. John P. Briggs, of Arundel Street, Strand.

No doubt seems to be entertained by the directors of the Great Central Railway Company that they will be able to open their new extension to London for passenger traffic next Easter, although the terminus and the great hotel may not be quite finished by that time.

A new Congregational church to seat 450 worshippers, with a lecture-hall to seat 350 persons, has been opened at Raleigh Road, Richmond. The church has been entirely built and furnished by Alderman Burt, S.C.C., and his wife.

A large house in process of construction in the Batignolles district of Paris fell in on the 18th inst., with a terrible crash, all the five storeys being completely demolished. After the first shock every effort was made to save the injured. Five men were found dead, and several marvellous instances of escape are recorded. From an examination of the ruins it seems that the accident was due to faulty construction.



At the foundation-stone laying of the new children's hospital at Norwich there was placed in a prepared cavity in the stone, besides the usual copy of the newspaper of the day, a brass plate with the date and this inscription engraved upon it:—Norwich population 113,000. Fastest train to London, 2 hours 37 minutes. Electric tramways commenced. Price of large sheep, 63*s.* Bricklayers' wages, 7½*d.* per hour."

A six days' carnival will be commenced at the Alexandra Palace on Boxing Day. Free entertainments will be continuous in the Central Hall, while twice daily special performances will be given in the theatre. On Wednesday, Thursday, Friday and Saturday there will be special entertainments for children, including dances, Christmas games, Punch and Judy show, and a huge Christmas tree from which every child will receive a present.

At the fourth meeting of the session of the Historic Society of Lancashire and Cheshire, Mr. J. G. Prentice in the chair, splendid facsimiles of the Battle Abbey Roll, Magna Charta and warrants for the execution of Mary Queen of Scots and King Charles I., bequeathed to the Society by the late Mr. Ashby Pritt, were exhibited. The paper of the evening on "The Finding of a Neolithic Floor at Meols," was read by Mr. Charles Roeder, who, in connection with his paper, exhibited a large number of interesting flints and other relics of later times found in Wirral, with plans and sectional drawings. At the close a discussion took place.

A stone vault containing human remains, has been discovered in a field at Freshwater, Isle of Wight. Two men were digging sand, about 2 feet beneath the surface, when they came across the cavity. On examination it proved to be a carefully-made stone vault, the inside measurement of which is 6 feet long, 17 inches wide and 27 inches deep, at the head being a stone pillow. The remains comprised a skull, the lower part of which had decayed away, no teeth being found,

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

and a few bones of the extremities. A small urn rested near the skull. The vault is thought to be of the Norman period.

TRUE to the principle which he has in his long career always found the correct one, *i.e.* that of giving his patrons the best fare procurable, Mr. Charles Morton's programme at the Palace affords Christmas holiday-makers abundant cheer. Among the popular turns which are on the bill, besides the perennially attractive Biograph, to which new pictures are constantly being added, are to be found the old favourite Harry Paulton, Lockhart's amusing performing elephants, Alice Peirce, the Eight English Roses, Wood and Shepard, Harrison Brockbank, the Clan Johnstone Troupe, the Euterpean Quartette ; Burke, Andrus and Frisco ; Cyrus Dare, the Levardos, Joseph Archer, La Tostia, W. F. Dempsey, Harry Pleon, Chas. Capper, &c.

AFTER a successful career of over thirty years, *Science Gossip*, the favourite journal for amateurs devoted to natural, physical and applied science, has just entered upon independent offices at 110 Strand. This magazine has latterly been greatly improved, and the articles deal with subjects of most recent discovery or theory. The editorial management is still under the control of Mr. John T. Carrington, assisted by Miss F. Winstone. There are also several specialists as departmental editors for such sections as physics, microscopy, astronomy, botany, geology, zoology, meteorology, &c.

DR. ARCHIBALD BARR, M.Inst.C.E., Professor of Civil Engineering and Mechanics in the University of Glasgow, will deliver an address on "The Application of the Science of Mechanics to Engineering Practice" to the students of the Institution of Civil Engineers on January 13, at 8 P.M.

THE new church of St. Peter, at Woodmansey, near Beverley, which was erected some months ago, and which on account of an ecclesiastical difficulty has remained unopened since, has been consecrated by the Archbishop of York. It is a handsome structure of red brick with stone dressings, and is situate on the high road to Hull and Beverley. The cost, including the price of the land, was about 2,500*l.* Mr. S. Beaumont, of Beverley, was the architect, and Mr. G. Pope, of Beverley, the builder.

THE EMPLOYERS' LIABILITY ACT.

AT the Clerkenwell County Court, on Saturday, in dealing with an employer's liability action, Judge Edge made some strong comments respecting such cases. In his opinion, he said, the majority of these actions ought never to be brought into court at all, the so-called injuries being of such a trivial kind that there was no ground for the claim. To a judge, however, they were the most difficult of all actions to decide. To try and bolster up his case the plaintiff would swear to anything, while a defendant would swear almost that the man had never been in his service. In dealing with the evidence of witnesses he looked on it with very great care, and at times with suspicion, owing to their probably being still in the defendant's employ. Perjury was introduced broadcast throughout the actions—in fact, it had become the most difficult thing a judge has to deal with now. A person would give evidence, apparently, in the most straightforward manner, and yet be committing the grossest perjury. Perjury had become such a common practice now in the courts that it was far more difficult for a judge to decide on which side the truth lay than to decide on the most technical point.

E. H. JONES'S KNIFE AND RAZOR SHARPENER.

THE small worries of life undoubtedly cause, in the aggregate, more discomfort and mental disturbance than those more serious troubles that we meet and conquer by a firm determination, and it is because they are small and of short duration considered singly. Amongst these not the least irritating is a blunt pocket-knife, and no means at hand to sharpen it, or perhaps only a sharpening stone which must be oiled, unless, indeed, it is already so oily that we soil our hands in picking it up. From this worry Mr. Jones has given us a means of escape by using his very simple though ingenious and durable sharpener. This instrument is used like a strop, which in form it resembles, but it is thicker for a reason that will appear immediately. It is formed from a block of soft wood, in which are made longitudinal grooves nearly to the bottom of the block, and which terminate within a short distance of each end. These grooves are filled with a composition of emery and some diluting earth with grease or oil for sharpening knives, and the razor strops are similarly charged with a finer composition necessary to produce the finest and keenest edges. The absorbent nature of the wood used is such that the composition does not become hard or "glazed," and it is pressed by the action of sharpening into the pores of the wood, so that a uniform sharpening surface is formed.

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards, Basements, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above uses,
Gold, Silver and Bronze Medals awarded, Brussels International Exhibition, 1897, for Hygienic Street and Stable Pavement. Highest Award at the Agricultural Hall for Kennel Paving, 1897 and 1898. Samples, Prices, and all particulars of THE IMPROVED CORK PAVEMENT CO., LIMITED, 21 ST. MARY AXE, LONDON, E.C.

London Showrooms—11 BARTLETT'S BUILDINGS, HOLBORN CIRCUS, E.C.

Some trials with the knife sharpener have shown its efficacy for pocket-knives which had been in disuse, and also good results followed its use upon pieces of steel ribbon. As a razor sharpener its advantages are even more marked; when used for "setting" a razor dulled by stropping the edge produced is much superior to that obtained from the use of a similarly charged leather covered strop, or even that which results from setting it on a German razor hone. The durability of this instrument—that durability meaning the time it will keep in working order—is no doubt due to the exudation of the oil from the wood under the pressure of the instrument being sharpened, and its reabsorption, which prevents evaporation, on the removal of that pressure. Mr. Jones proposes to use a double-faced sharpener for scythes and similar implements, but we have had no opportunity of testing the larger sizes, although we have no doubt they will be equally effective.

ARCHBISHOP'S HOUSE, CANTERBURY.

A CONTRACT has just been approved by the Ecclesiastical Commissioners for England for the erection of an archiepiscopal residence in the Cathedral precincts at Canterbury in place of Addington Park, which was sold in the early part of the year. The remnant of the archiepiscopal palace known as "Old Palace," which is situated close to the west front of the Cathedral, will form the nucleus of the new residence. The ancient palace was founded by Archbishop Lanfranc (1070-89), and first abandoned by Archbishop Wareham (1503-33) in consequence of a dispute with the citizens. In Cranmer's time (1533-56) it had fallen into decay, and was further gutted by a disastrous fire. It was restored by Matthew Parker (1559-76), who gave a magnificent entertainment to Queen Elizabeth within its walls, but he appears to have been its last occupant, and the building was after his time again allowed gradually to fall into decay. Some portion of the ruins has been alienated to the use of the King's scholars, and an ungainly red brick house in Palace Street, which incorporates some of the ancient structure and is occupied by the junior school, is still known as "The Palace." The remnant, which will now be incorporated in the new residence, remained the property of the Archbishops of Canterbury until about thirty years ago, when it passed to the Dean and Chapter and was transformed into workshops, but it has now been reacquired.

HUNSLET NEW BATHS.

THE new public baths in Joseph Street, Hunslet, erected by the Leeds Corporation at a cost of about 12,000/, were formally opened on the 17th inst. This makes the fifth institution of the kind now possessed by the Corporation. The others are at Union Street, Kirkstall Road, Holbeck, and Cookridge Street, whilst in a few weeks a sixth set of baths will be opened in Meanwood Road. The new brick structure at Hunslet very much resembles the one recently erected at Holbeck. Standing on slightly raised ground, the building fronts into Joseph Street. In the centre is the office, with the entrances to the first and second-class baths on each side. The slipper baths—twenty in all—are on the right of each entrance, consisting of ten second-class for men, five first-class for men, and five for ladies, with all their appurtenances and sanitary arrangements distinct and separate. Store-room accommodation is provided in connection with this section. The second-class swimming-bath is 85 feet by 46 feet inside walls, and the water measure in the tank is 75 feet by 30 feet. A gallery is provided all round for spectators, with three staircases, one from the entrance and two in bath-room. Dressing-boxes are provided along each side of the bath. The divisions between them are of polished slate. The first-class swimming-bath has a water measure of 63 feet by 25 feet. There are dressing-boxes along each side, with polished marble divisions. The bottom of the baths is in Venetian marble mosaic, and the side walls in white glazed brickwork, with stone coping on top, and the ground floor, consisting of aisle and dressing-boxes, in concrete. The walls throughout are in glazed and pressed brickwork. The laundry is between the two swimming-baths, and is fitted up with the usual appliances required for that purpose. The baths buildings are on the ground level, and are only one storey high. They are well lighted by louvre ventilating lights and side lights. Excellent provision is made for supplying fresh air to the buildings, and the extracting power is obtained not only from the louvre lights, but from a large Blackman's fan fixed in the gable of the swimming-bath. The buildings are properly warmed throughout by steam pipes from the boiler. The only part of the structure more than one storey high is the block over the office and entrances, which provides house accommodation for the manager. The external walls are in pressed brickwork with stone dressings, and the roof is covered with Westmorland slates, and wood and plasterwork has been avoided in every part of the buildings wherever possible.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE annual general meeting of the Royal Institution of the Architects of Ireland was held on the 15th inst. in the new rooms of the Institute, 20 Lincoln Place. Mr. Thomas Drew presided, and there was a large attendance of members.

Among those present were Messrs. A. E. Murray, hon. sec., W. M. Mitchell, R.H.A., J. R. Carroll, Charles H. Ashworth, Fred Bachelor, F. L. W. Blount, W. J. Gilliland, Chas. Geoghegan, W. D. Doolin, M.A., C. J. M'Carthy, city architect, R. S. Swan, R. M. Butler, A. W. Moore, J. Holloway, R. Caulfield Orpen, M.A., G. P. Sheridan, G. L. O'Connor, E. H. Morris, J. H. Webb, Harry Allberry, W. Kaye Parry, M.A., Robert Cochrane, Robert Stirling, R. O'B. Smyth, Cecil Orr, J. H. Pentland, R.H.A., Fred Franklin, Richard C. Millar, C. A. Owen, M.A., Frederick Hayes, J. F. Delaney, F. Hicks, Louis Deane.

Mr. Albert E. Murray, Fellow, hon. sec., then read the report of the Council for 1898, of which the following is a summary :—

There has not been much increase in our numbers since our last meeting. Yet we have not been standing still, and we have lost none of our members. Our roll now consists of twenty-seven fellows, fifty-seven members and six probationers, making ninety all told. We are glad to say that our experience during the past year as one of the allied societies of the British Institute has been very satisfactory, and that our relations have been perfectly harmonious throughout. We feel the advantage of being in touch with the great central body of our profession. Every movement of importance which takes place there is at once communicated to us, while we have complete control of our own local affairs. Such an alliance cannot fail to be of great value to us in many ways. It secures uniformity of practice between ourselves and our brethren across the water, and strengthens our hands. We trust these friendly relations may continue to unite us in the future. A concession has recently been made to provincial architects by the British Institute, and mainly at the suggestion of this Institute, to the effect that any member of the profession unanimously recommended by the council of an allied society will be practically approved a Fellow of the British Institute. We wish to draw attention to the fact that while both in England and Scotland a large number of allied societies, each having its centre and well-defined boundaries, have been established, Ireland shows on the map of the British Institute as a single province with its centre in Dublin. The Council feel that this state of things is not creditable to the professional spirit of Irish architects, and trust that a movement may soon be initiated to establish local allied societies in Ireland with spheres of influence and with other centres than Dublin, while fully maintaining their connection with this Institute. We expect that much benefit will result from the operations of the Local Government Act, and particularly that the Acts relating to public health will be more efficiently enforced in many districts than they are at present. During the past year we have had under our consideration the conduct of two architectural competitions of some importance, one in Belfast and one in Dublin. In each case we have endeavoured to induce the promoters to adopt the rules for competitions laid down by the British Institute. While it is very important that the public should be educated into taking more equitable views of the rights of architects in these matters, it is equally necessary that our members should perform their part also, and refuse to compete in cases where the terms proposed are unsatisfactory. If this principle was consistently carried out the public would soon learn to set a higher value on our services and would cease to expect to obtain them for nothing, as too many appear to do at present. Although no further progress has been made recently towards a settlement of the architects' registration question, we desire to impress on our members that, if they will only act together, they can secure for their profession most of the benefits which are the aim of the promoters of this Bill. We are glad to say we are now in a better position in this respect than we have ever been, and fresh evidence is afforded us every year of the growing esteem enjoyed by our Institute. We ought not to rest satisfied until every architect in Ireland worthy of the name belongs to us. In order that the benefits of membership should become more widely diffused, we propose in future to hold periodical meetings here, at which papers on professional subjects will be read and discussion thereon invited, and we hope shortly to announce our opening meeting. They will be open to all our members.

Mr. Kaye Parry moved the adoption of the report. He suggested that societies might with advantage be started in Belfast and Cork, where a good many architects were in practice. With reference to the Local Government Bill, they had reason to know that the representatives of the architects

THE WELL-KNOWN FRIEZE
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

of Ireland had their due weight in the framing of the measure. The most important part in the report was the question of registration, but really if membership of the Institute was sufficiently recognised in courts of law as entitling a man to be a practising architect they had all they wanted. They had been very careful as to whom they admitted to the Institute.

Mr. Chas. Geoghegan seconded the motion, which was passed.

Mr. Drew then delivered his address. He said:—Allied societies will be the chief topic of my retiring address to you, as it has been one of the foremost movements which have occupied your Council during the now long term I have been president. It seems but the other day that the great body organised and chartered as the Royal Institute of British Architects was through conservatism falling out of touch with the vast body of architects that had grown up in the cities of the empire at home and abroad since its early foundation. An executive localised in London, though composed of foremost and earnest men in the profession, had to realise that the membership and influence of the Institute was not extending as it ought, and appeal was made to architects in the provinces as to their apathy. From independent architectural societies came back the response generally, "How, under its present constitution, can the Institute look for any other state of things? The Institute as it stands represents a vast body of architects in London equal in number to all the architects of provincial centres, but is in itself practically a great provincialised and local society." In this controversy our Institute, as one of the remotest from the London centre, illustrated the weakness of non-adhesion most pointedly, and, as in more or less degree, the position of an architect in any provincial centre. It is now a tribute to fair-mindedness of the London executive that it has by its acts in a marked degree adopted the views of the non-conforming provincial architects. Notable among its acts has been to widen the representation on its Council by admission of representatives from provincial centres. Here let us acknowledge the generous compliment conceded to our small Institute of the sister country—that, while the representative seats at the Council from the provinces generally are elective, limited in number, and sought as a distinction, it has been conferred on the Irish Institute that its president, being a Fellow of the R.I.B.A., shall ex-officio hold a seat on the Council without election. May I inform you also that the Council of the R.I.B.A., by recent by-laws, take powers, during their pleasure, to dispense with the entrance fees of non-metropolitan members? Further, it takes privilege to elect without ballot to the Fellowship of the Institute the president of any allied society for the time being. May I, on retiring, urge on my successors to qualify for holding this position if not already members of the R.I.B.A.? In my case, during the years I have been your representative, I can assure you of what practical value I have found it to our Society to be in communication and correspondence with the central body, to have recognition of the right to appeal to it, and the personal friendship and cordial goodwill of the leading architects of the day to the small knot of Irish architects. Let me further announce what advantages have been conceded to the provincial architect, brought about by the happy policy—I know not by whom first suggested—of allied societies to the Institute, which has in principle solved the problem of decentralisation of the R.I.B.A. England, Scotland and Ireland have been systematically mapped out as architectural provinces and spheres of allied societies. As to there being a sole province of the Royal Institute of Architects of Ireland, with its centre at Dublin, that unit is not pleasing to me or creditable to the professional spirit of the architects of Ireland. Can we, the executive of the sole architectural body for Ireland centred in Dublin, for an hour pretend that our sphere of influence extends over the great and growing city of Belfast, soon to surpass our city in numbers of its population, and, in the amount of architectural practice, probably at this moment in the number of reputable architects practising in it? It is with great pleasure I announce to you, in ready response to a suggestion of mine, the presence of some brother architects from Belfast, and it is the desire of our visitors to have a talk with some of their Dublin brethren on this subject. That is the topic in connection with the advantages of architectural alliance most interesting to us at present. After enumerating the advantages to provincial architects under recent reforms of the R.I.B.A., the President continued:—I desire to suggest to this meeting the appointment of a standing art committee of the Institute, whose concern should be with public and civic improvements or disfigurements, architecture threatened with demolition or degradation or neglected, and to direct public attention to them with an authoritative opinion. Outrages on the dignity and beauty of our streets, which are the common inheritance of all citizens, are too often perpetrated by the ignorance or selfishness of individuals or the density of official bad taste. Improvements which are possible and patent to the expert eye of the architect are dormant and unnoticed. "What is

everybody's business is nobody's business." As architects will not move in such matters what other body is likely to do it? Such an institution does good service in London in the form of a standing art committee of the R.I.B.A., often aggressive to public bodies in general and the London County Council in particular. It has even, I believe, extended its purview to Irish affairs, and has memorialised the Provost and Board of Trinity College that the fine work of Sir William Chambers should not be degraded by incongruous association in juxtaposition with brick building of the utilitarian artisans' dwellings type. To the cathedrals of Dublin it has given some intelligent interest. Surely there is a work to be done by ourselves gratuitously for our citizenship and our local affairs in a like way with the right attaching to educated opinion to make itself heard, and, I believe, to be received well by our own municipal rulers who, in Dublin at least, are on kindly terms with its architects. For instance a case—at the moment occurring to me—I have noted a casual reference at a late meeting of the Corporation to a scheme for providing office accommodation by in some manner dividing or utilising the grand circle under the dome of the City Hall, the work of Cooley, of which we are so proud. Surely Irish architects should be vigilant as to what this innovation may portend, and, if a degradation or disfigurement, remonstrate. Again, we look down the Liffey to the western sunset from O'Connell Bridge to point out one of the most exquisite pictures of Dublin landscape, and to see it marred, disgraced and outraged by giant invitations to try somebody's bread, and as a corrective, perhaps, following with some one's aperient pills, or, until lately, an infallible epileptic remedy. As if these were not enough, another firm all over the place suggests mineral waters, another to play its pianos. I believe it may not be in the immediate power of the Corporation to abate this eyesore, but I believe public opinion directed to it would bring home to individuals who perpetrate such things, in ignorance perhaps, they give grave offence and disgust to a community far more widely than they estimate—that such advertising is far more injurious than serviceable to their business. Skeleton sky-signs begin to appear in the best architectural streets of our city. Advertisement hoardings are always with us. Is the municipal authority always assured that these may not be "got at" as "dangerous structures?" I have known one instance at least when the attention of our thoroughgoing city engineer was drawn to the invasion of the beauty of Dame Street by 12-feet letters being skyed upon a parapet, and how promptly he showed a stranger invading firm that municipal Dublin had some powers in such cases. Tramways and trolleys, posts and cantilevers and overhead wires, these are past praying against. The Juggernaut of Progress passes by and sorrowing architects must bow, but much of the beauties of cities—in Dublin, and very noticeably in newer Belfast—might have been saved to them if such a public body as societies of architects had watched over them. There just exists now, in a last stage of degradation and neglect, the last surviving hall of the 24 guilds of which the Corporation of Dublin was constituted fifty-six years ago—the Weavers' Hall in the Coombe. It is an interesting and fine old Queen Anne or early Georgian hall, which it is a disgrace to the city to allow to disappear. It is not past praying for at least. If architects will not find it out, and direct public notice to it, and say that its dilapidations are not past repair, who will do it? Belfast, one day, in selfish greed for value of street frontage, wipes out from its map two little open spaces, with pretty trees which flanked and gave a simple charm to the entrance on its municipal thoroughfare of Donegall Place. More lately, it has no sooner acquired its first central area than it proceeds to spoil it for ever by planting its town hall in its centre and blocking it, interrupting a grand line of central thoroughfare which might have made Belfast noticeable among cities. By blind bad taste and obstinacy an opportunity is irrevocably lost which no architect could regard but with sorrow, or good citizens without regret. Yet in such a case exists no organisation to protest against the tyranny that forces on such schemes. When I have touched on the up-river disfigurement some visitors may have wondered that a down-river disfigurement which freshly shocks their sense, the notorious Loop Line outrage, was not alluded to. It is because it is for us Dublin architects ancient and painful history—fifteen years old. It is a memory of that needless outrage of the beauty of a beautiful city, of the obstinate engineering doggedness which forced its way through our public thoroughfare to the west instead of the east of the Custom House, of the irresponsible tyranny of wire-pulling in such projects. The architects of Dublin, appealed to by the Press, took their part at the time in leading protest against what seemed a proceeding almost incredible in its extent and ill-design. It points the moral of the necessity of some volunteered censorship to defend the rights of citizens in their own city. To no architect can that ill-starred blot upon the city of Dublin be ever anything

but a distress, with its ragged-ended rusty girders above and its manifestly sham and inadequate pieces of foolish architectural pretension below; its five specimens of absolutely differing and incongruous pieces of bridge-building going to make up one-quarter of a mile of a continuous viaduct, and, we may add, each specimen more uncouth than the other as you get northward; and behind all this Gandon's Custom House, once the pride of Dublin as you viewed it from old Carlisle Bridge, blotted from pictorial Dublin for ever. But, gentlemen, it can only be said in press language, not unfamiliar in the annals of crime, "no one was brought to the bar of justice in connection with this shocking event. The perpetrators may be still alive and walking in our midst, but in all human probability will never be discovered." With such suggestions for the extended work of our Institute, I vacate the chair with a sense of the friendship and loyalty and unselfish co-operation of colleagues through a long term of years, such as I believe has never been acceded to any president of a like Society to ours.

Mr. Walter Doolin, having expressed his hearty appreciation of the President's address, said he thought that a helping hand and support should be extended to the Architectural Association of Ireland and the younger members of the profession.

Mr. Rawson Carroll thought that while registration would be of great use to them as well as to the public, still at present, if properly regarded, membership of their Institute was a sufficient guarantee of a man's efficiency. He offered the chairman hearty thanks for his able address and his services to the Institute.

Mr. Cecil Orr thought they should do more for the Architectural Association and help them on. He thought there should be some qualification more than mere membership of the Institute. His recollection was that the attitude of the Institute originally was in favour of registration.

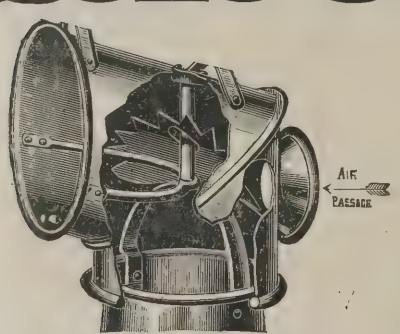
Mr. Butler supported Mr. Orr's views.

Mr. W. J. Gilliland, Belfast, spoke in favour of registration. They would never be protected until they had it. He was, therefore, entirely opposed to that portion of the report which rather jumped on registration.

Mr. Kaye Parry said he was far from believing that the end-all of an architect's ambition should be merely membership of their Institute, but he thought it was a useful step and assistance.

On the motion of Mr. Rawson Carroll, seconded by Mr. Wm. M. Mitchell, the following resolution was passed:—

"That a standing art committee, on the lines and exercising functions similar to those of the standing art committee of the Royal Institute of British Architects, be appointed in connection with the Royal Institute of the Architects of Ireland."



The result of the ballot was then announced as follows:—*President:* Mr. Thomas Drew. *Hon. Sec. and Treasurer:* Mr. Albert E. Murray. *Council:* W. M. Mitchell, Rawson Carroll, J. H. Pentland, George C. Ashlin, George O'Callaghan, Charles Geoghegan, Kaye Parry, Walter Doolin, Cecil Orr and F. Bachelor.

TENEMENT HOUSES IN DUBLIN.

At the last meeting of the Statistical and Social Inquiry Society of Ireland, Mr. Charles Eason, jun., read a paper on "The Tenement Houses of Dublin: their condition and regulation." In the course of his address he said:—Several efforts, worthy of all praise, are being made at the present time to provide additional or better accommodation for the poorer classes. Some ladies connected with the Alexandra College have formed a company for the purpose of buying some houses, putting them in order, and letting them at rents as low as possible. Any sum over after paying 4 per cent. interest to the shareholders is to be devoted to carrying on the work. The ladies will take a practical interest in the work by collecting the rents and looking after the houses, and much good will result from the knowledge which will be thereby gained of the conditions of life among the poor. A company is also being formed with a capital of 20,000*l.* for the same purpose. This scheme is the outcome of meetings held at the Mansion House during the past twelvemonth. The object aimed at is specially to provide accommodation for the "very poor," that is to say, for persons who cannot afford to pay a rent of more than 1*s.* 6*d.* or 2*s.* per week. The Corporation have had in hand for over five years a scheme for providing dwellings in the district of Bride's Alley. A sum of 32,000*l.* has been spent, but no plans for erecting new dwellings have yet been adopted. At the present moment a proposal in regard to the site has been submitted to Lord Iveagh. That so large a sum should have been spent merely on the acquisition of a site is very discouraging, and it is difficult not to think that full use was not made of the powers of the Corporation for the acquisition of unsanitary dwellings. At the Public Health Congress Sir Charles Cameron and the Right Hon. Alderman

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

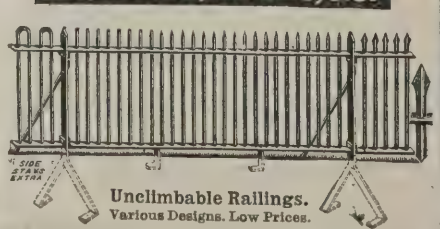
This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."



"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

Meade urged that the Corporation should be allowed to erect dwellings for the "very poor" on special terms, such as a grant of the site free of cost and freedom from city rates. That is, in fact, to a certain extent at the expense of the ratepayer. In regard to a free site, it is urged that the clearance of an unsanitary area is a sanitary improvement for the benefit of the whole city, and may therefore be rightly treated as an outlay for sanitary purposes. At the present moment the London County Council has adopted the principle of providing dwellings, at a loss to the ratepayers, in a special case. Time prevents me from discussing this question; but the principle is of the utmost importance and should not be adopted without very thorough consideration. The idea of confining the dwellings to the "very poor" is not one that seems wise or practicable. Rooms must vary in size and position, and consequently in value. More satisfactory results are likely to result from persons of different incomes living side by side, and renting rooms in proportion to their incomes. More information should be obtained as to what has been done in other cities. A large scheme has just been made public by Lord Iveagh. He proposes to take an area near St. Patrick's Cathedral, clear it, and build upon the site shops, dwellings, baths, gymnasium, public hall, &c. Such a scheme is deserving of our warmest approval, and all parties who have any influence should use it to facilitate its execution. The extension of the city boundary to include the adjacent townships would give increased power and additional facilities for the improvement of the condition of the city. The well-to-do people who live in these townships escape at present their due share of responsibility. The question is not one to be settled simply by a reference to the effect upon the rates. The present boundary is purely artificial. The people on both sides of it are, in fact, one community, and all should be willing to co-operate in the task of grappling with the social problems of the city. There is nothing new in this paper; the evils pointed out, their causes and the possible remedies have been brought before the public time after time. There is no royal road to their removal. An improvement can only come from personal effort and self-denial on the part of the citizens of Greater Dublin.

Mr. Pim, the president, said Dublin suffered more from overcrowding than any other city. Some time ago the proportion was ten persons to one house in Dublin, as compared with five in Belfast. Of course, that was largely due to the fact that Belfast was a new city, but as he understood, the state of affairs so far as Dublin was concerned was not so bad.

The Registrar-General (Dr. Grimshaw) said the population of Dublin was under 250,000, but if they took in the surroundings they got a population of 350,000. Since the date of the Royal Commission on Sewerage and Drainage in 1879 there had been a considerable improvement in the state of the tenement houses, and this was, he thought, partly due to the increased number of well-to-do people going to live in the suburbs and leaving the city houses for tenement occupation. Very much, he thought, could be done by visiting the tenements and offering encouragements to cleanliness. The system which had been started in London by Miss Octavia Hill, and which had grown to such great proportions might, he thought, be tried with advantage in Dublin. That lady took houses, let them in tenements and collected the rent herself or by the aid of some lady assistants. In regard to space he held that 300 cubic feet for a sleeping room was not sufficient. That figure had been generally selected because it was thought to be all that could be obtained. He believed that the tenants should be fixed with a certain amount of responsibility for the cleanliness of the tenement and the protection of its fittings from injury, and he held that every apartment should be marked with the number of people it was to contain. As to the clearances of areas, these should be made irrespective of any consideration of profits; the real return to the ratepayers for this expenditure would be better health and a decrease of crime. In Glasgow the largest measures for the housing of the working classes in the United Kingdom had been carried out at the cheapest rate and in the most satisfactory manner, and he commended what had been done in Glasgow to the people of Dublin.

Mr. Carton, Q.C., said three parties, as it appeared to him, were responsible for the wholesome housing of the poor. The first of these was the Corporation. Hard things had been said of the Corporation, but in his experience the Corporation officials had been most efficient, zealous and painstaking in the discharge of their duties. In fact, if any fault could be found with them it was that they had been rather severe on the owners of tenement houses. But the sanitary by-laws of the Corporation were singularly inadequate. He had recently had to dismiss a case of overcrowding, because although the by-law fixed the number of occupants for a house it did not give power to prevent the number from being exceeded. The second party responsible for the housing of the poor was the owner of the tenement house. It was his experience that on the whole the owners of tenement houses were loyally willing to carry out all

that was required of them. No doubt they had, in some cases, shown a disposition to scamp the work and get off with doing less than was required. The greatest fault that he had found with them was their delay in executing the improvements that were ordered, but in order to meet this state of affairs he had adopted the practice of allowing shorter time in the first instance for the doing of the work and of extending it afterwards, if he found that the landlord *bonâ fide* intended to obey. The present state of the tenement houses in Dublin was not, he thought, to be attributed to them. The real fault lay with the occupiers, and it was his opinion that the efforts of the Corporation and their officials and of reformers should be directed towards obtaining legislation to impose on occupiers the responsibility of keeping their places clean. Cases had arisen over and over again in which the owners of the tenements had provided the best sanitary arrangements, and these had been a fortnight afterwards rendered useless by misuse.

Sir Charles Cameron said that some hostile critics of the Corporation considered they were now worse as regarded the tenements than they were twenty years ago. If that were true large sums of money had been wasted. The terrible system of storing foul matter in the city had been got rid of within the last year or fourteen months. That surely would be a great deal, if no other improvement had been effected. But a great deal more had been done. The worst purlieus had been completely got rid of. The magistrates had made orders for the closing of more than 3,000 insanitary houses, and of these almost 2,000 had for ever disappeared. He could mention the names of forty courts and alleys every single house in which had been removed during the last twelve or fourteen months. It must, however, be admitted that the condition of the tenement houses of Dublin was still highly unsatisfactory. The Corporation had always shown the greatest willingness to adopt reasonable suggestions; but the problem they had to solve as regarded the dwellings of 32,000 out of the 54,000 families in Dublin was an almost insolvable problem under the existing circumstances. A census which was made some years ago of the number of tenement houses requiring inspection in the city showed that there were 32,000 families occupying 48,000 rooms. The number of inspectors in the service of the Corporation was limited, and each had about 1,200 tenements to inspect in the year. It was a long time since that he had come to the conclusion that they could no longer go on closing insanitary houses, except in extreme cases, until provision was made for the accommodation of the people who had to be turned out of them. Why did not the State give assistance in this matter, as they did in the case of agricultural labourers? He was of opinion that the old mansions and residences that had fallen into disuse were quite unsuitable for tenement dwellings.

Mr. Ormsby said that articles had been signed for the formation of a company, the object of which was the housing of the poor of Dublin. The project was not solely philanthropic, but was to a certain extent commercial, for it was intended that 4 per cent. should be paid. Anything, however, made beyond that would be returned to the tenants.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

25602. Michael Wilbertz, for "Improvements in roof plates."

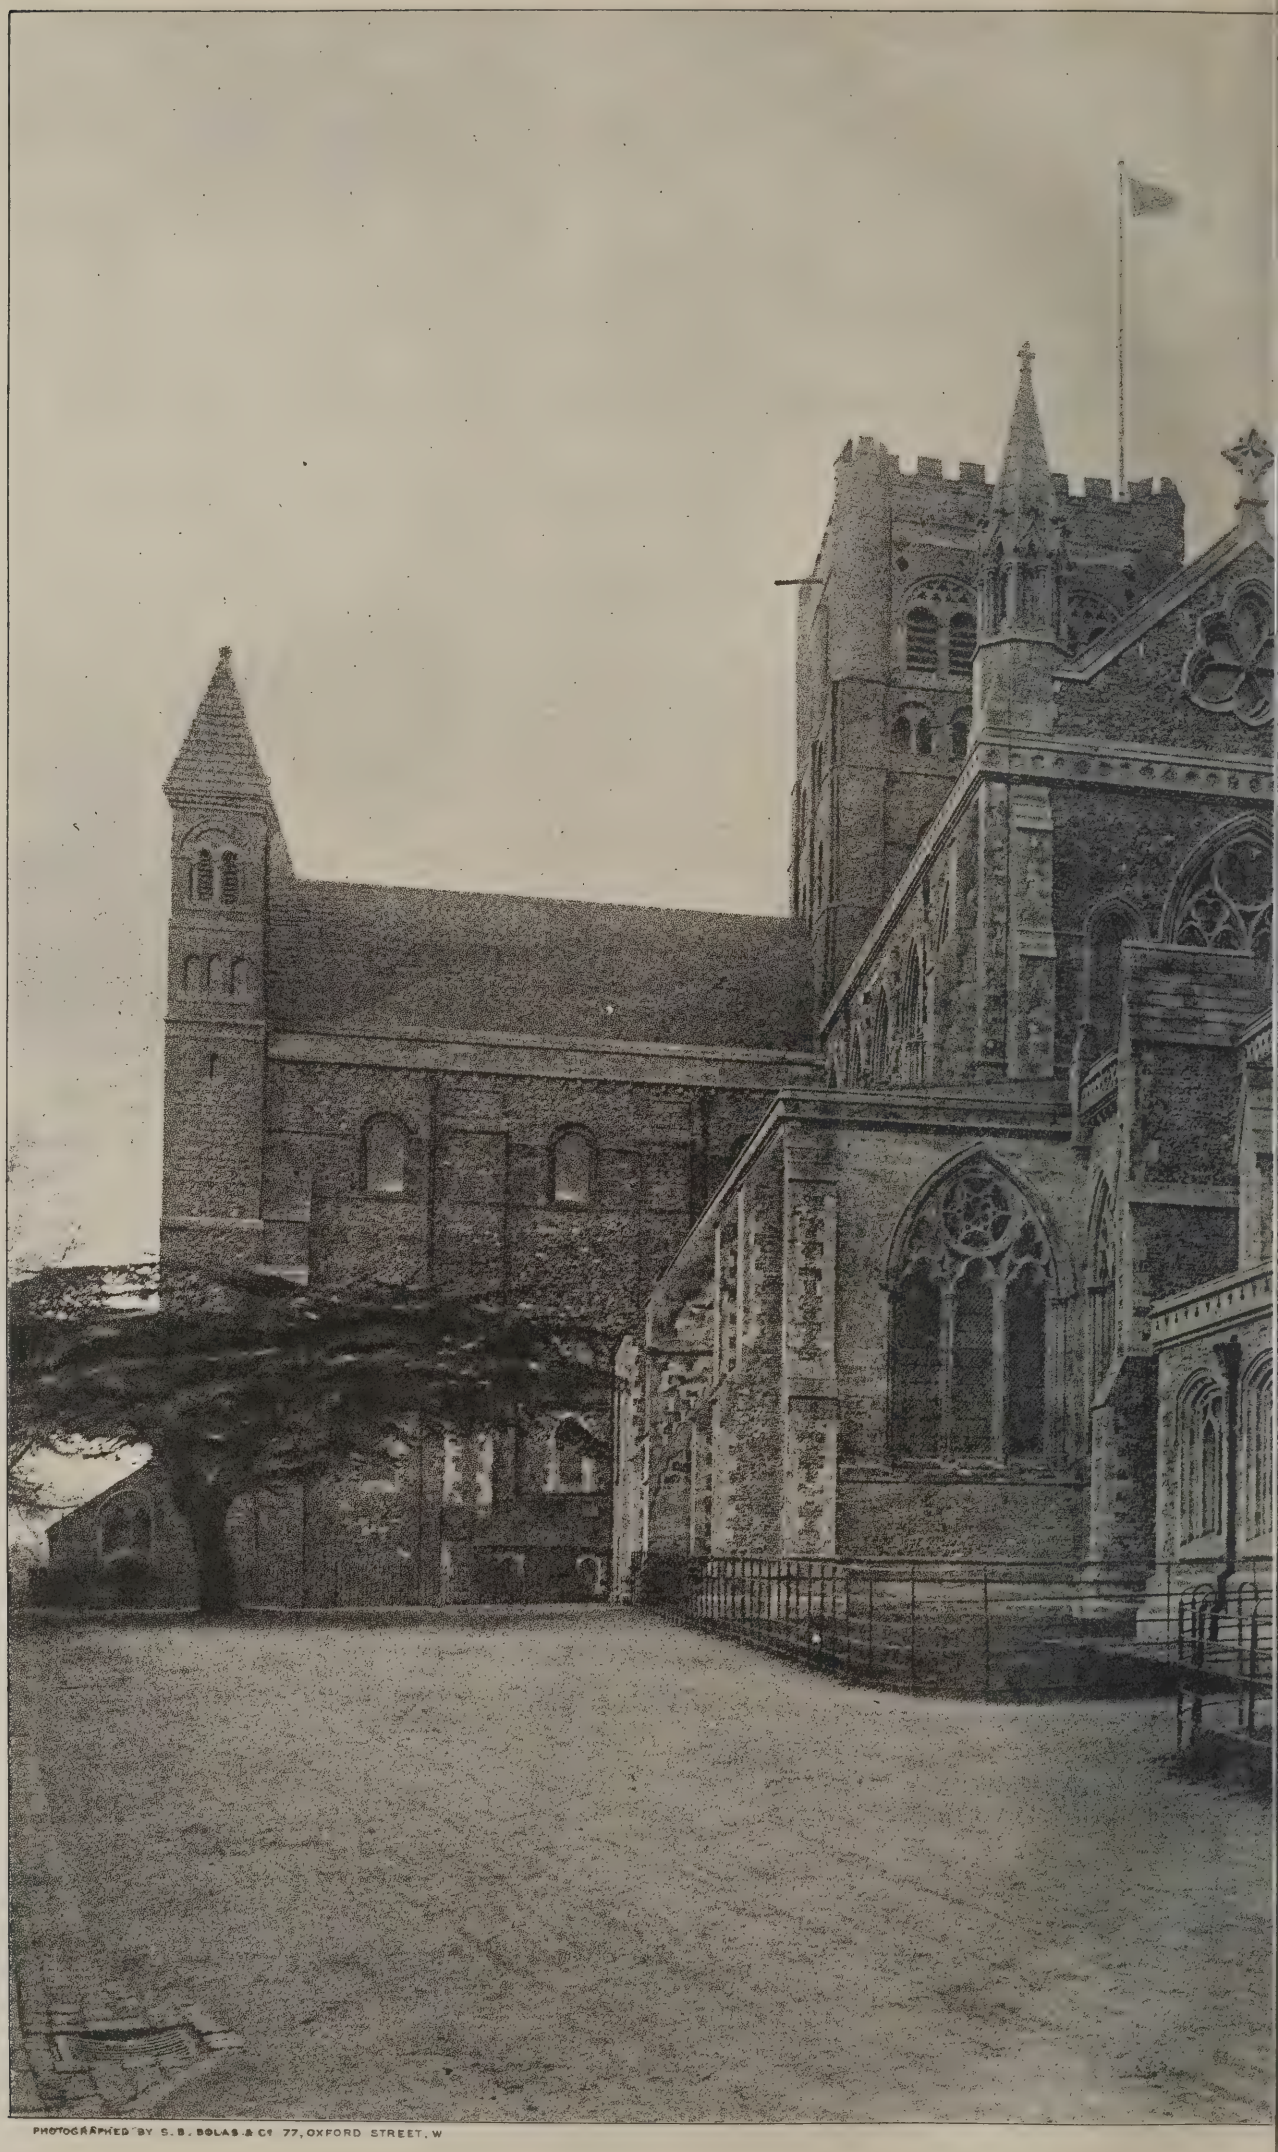
25785. Hilder Daw, for "Retaining apparatus for casting walls made of concrete or other suitable material."

25839. Frederick du Bois, for "The patent hot-air brick."

25943. Joseph Webb, for "An improved method of protecting or packing glazed and other brick, tiles and other goods."

Specifications Published.

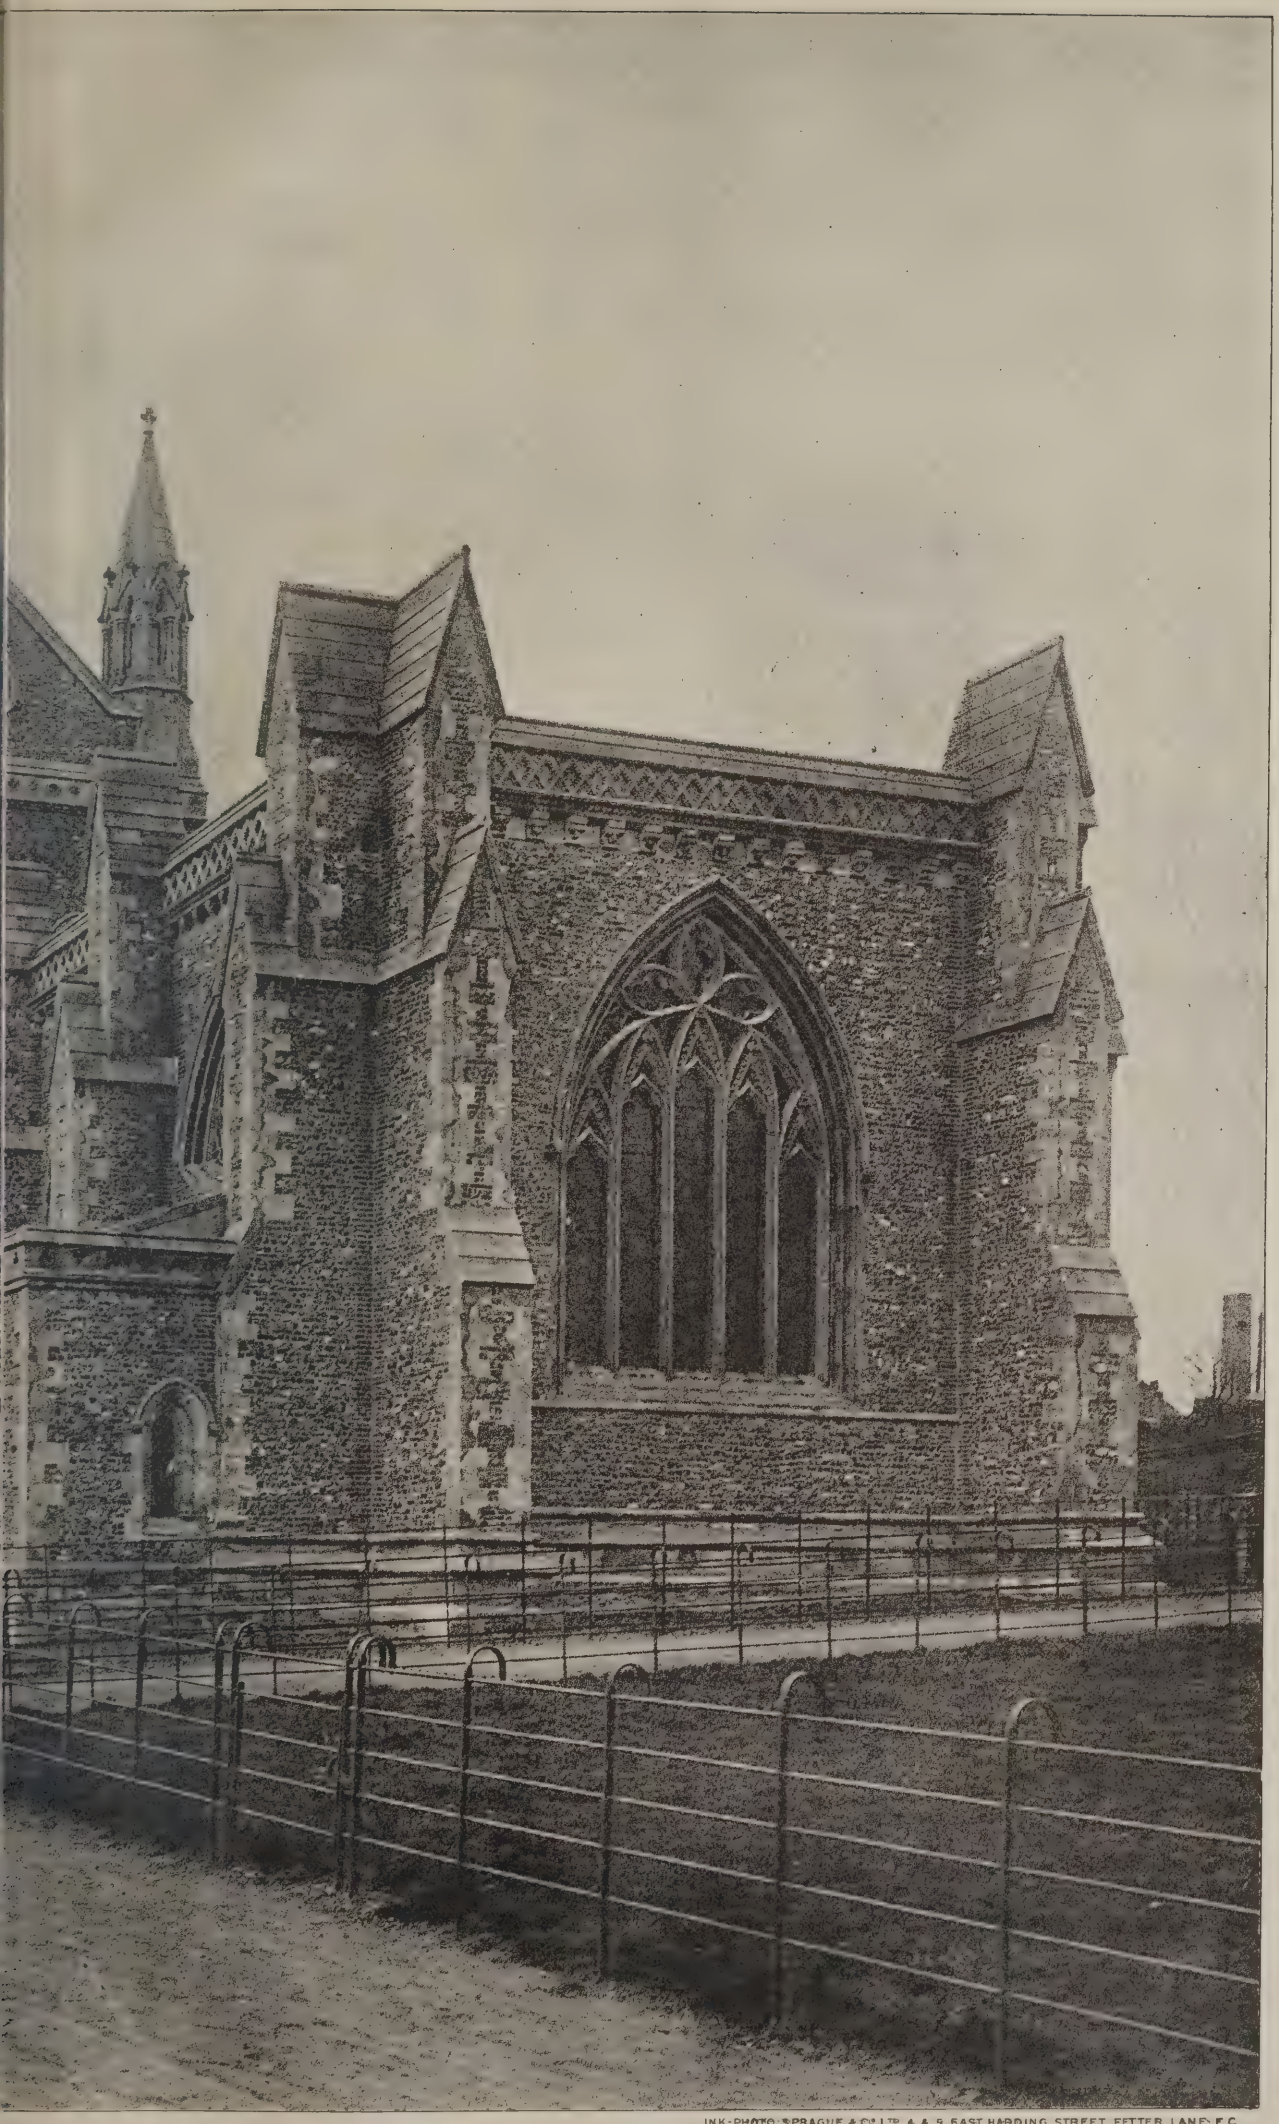
14654. Heinrichs, for "Brick-kilns."



22678. Godwin & Pickerill, for "Wall, ceiling and other tiles."

22997. Schroeter, for "Cement for attaching surface material, tiles, glass plates or the like to building surfaces and so forth."

23159. Van der Vijgh, Van der Vijgh & Van der Vijgh, for "Manufacture of artificial stone."



To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

J. W. BROOKER, Architect.

The Architect.

THE WEEK.

The Council House, Birmingham, of which Mr. Yeoville Thomason was architect, is not large enough for the municipal business, which is now carried out on a more extensive scale than formerly. Several departments have to suffer inconvenience through insufficiency of the offices. The accommodation in the art gallery is altogether inadequate for the proper housing and display of the art treasures which by the munificence of private individuals have become the property of the Corporation. There fortunately happens to be almost available a plot of land forming part of the Colmore Estate, which is bounded by Congreve Street, Great Charles Street, Margaret Street and Edmund Street. This land has an area of about 10,000 square yards. It is now covered with old buildings on short tenancies, which produce a gross rental of 1,071*l.* 14*s.* The trustees of the Colmore Estate calculate an ultimate ground rent of 5,160*l.*, or 10*s.* 6*d.* per square yard, as likely to be derived. Their advisers, however, propose that a lease for 999 years should be granted on the following terms:—For the first three years a ground-rent of 2,000*l.*; fourth year, 2,500*l.*; fifth year, 3,500*l.*; sixth year, 3,500*l.*; seventh year, 4,000*l.*; eighth year, 4,500*l.*; ninth year, 5,000*l.*; tenth and following years, 5,400*l.* The general purposes committee say it is most desirable that the new buildings, both for offices and for the art gallery, should be in proximity to, and if possible in connection with, the existing Council House. The plot of land now offered is the only piece which would enable this object to be carried out. The ground-rent asked is considered by them to be a reasonable one, and the committee therefore recommend that the offer should be accepted. The question of the utilisation of the land to the best advantage when acquired is one which will require the most careful consideration. The immediate requirements of the Council will be satisfied by building on a portion of the land only, and obviously the selection of this portion with a view to maintaining existing rents will be a matter of importance. The first question that will arise will be the possibility of connection of the new buildings with the present Council House and art gallery, either by bridge or subway, or both, and it will be necessary in the very earliest stages to obtain the best professional advice. The committee therefore recommend that they should be authorised to select an architect, and after consultation with him to submit to the Council their proposals for laying out the land to the best advantage. The subject will be brought before the City Council on Tuesday next.

It is satisfactory to know that the Kapellbrücke of Lucerne is not to be demolished, notwithstanding the reports to the contrary. Indeed, it would be strange if the inhabitants allowed a structure to disappear which was so closely connected with the lives of themselves and their forefathers. As Mr. Ruskin says, the bridges were to the population of the town what the Mall was to London or the gardens of the Tuileries are to Paris. For the continual contemplation of those who sauntered from pier to pier pictures were painted on the woodwork of the roof, historical scenes like the series of Swiss battles, and emblematic scenes like the "Dance of Death." The gable paintings of the Kapellbrücke were executed about 1611. Of the historic Swiss series many have disappeared in the course of time and through alterations in the quay; there are some sixty-nine remaining. The second series consists of quaint pictures from the lives of St. Leodegar and St. Maurice, the patron saints of Lucerne. Of the latter series there are now thirty-six on the bridge, certain scenes from the life of St. Maurice which were almost effaced having been moved in the course of this year.

The Botanic Garden in Brussels is from its position one of the best-known features of the city. As the greater part is enclosed by open iron railings, it can be seen by all who pass, including the numerous English tourists who have arrived at the neighbouring railway terminus. Many strangers are satisfied with the views from the road, and the grounds are so arranged as to look well from any point of vantage. The gardens are now acquiring a new interest. Brussels possesses many excellent sculptors whose works will bear comparison with works from Paris. In decorative sculpture Belgium on that account is able to uphold its ancient reputation. The skill with which figures to be placed out of doors can be modelled is suggested by the statues of typical guildsmen which surmount the railings of the little square known as the Petit Sablon in Brussels. The Botanic Garden is also to be adorned by bronze figures, but, instead of recalling the days of Horn and Egmont, as was fitting in a place of the old town, the statuary will symbolise vegetable life. Already the rose, the ivy, the chrysanthemum, the vine are embodied, while other figures and groups are commissioned.

A fallacy which prevails among owners of insanitary property is that more leniency is to be found in law courts than with corporate bodies, unless in cases like some of the London vestries when owners of the same class have contrived to gain authority. A curious case which should enlighten those people has been decided in Glasgow. The Corporation had ordered a house to be closed, whereupon the owner appealed to the Sheriff's Court. The appeal was dismissed, all that the owner gained for the extra expense being the postponement of the closure for some days. His plea was that the Police Commissioners were interested parties, and that he avoided bringing evidence before them because no man is called upon to tender evidence before judges who are also prosecutors. The Sheriff, on the contrary, held that the Commissioners "have no personal interest whatever in the matter, and are only concerned with it in their corporate official capacity, as the statutory executive whose duty it is to give operative effect to the public health protective provisions of their Act, and there seems no ground whatever for the unreasoning fear which the appellant seems to have that any evidence he laid before the Commissioners would not be impartially and carefully considered." In conclusion, the Sheriff said:—"If the appellant's case were that he had evidence now to submit which was not available when he was before the Commissioners, I might perhaps remit the case back to them; and if appellant has any genuine defence I hardly think the Commissioners will, even yet, stand upon the technicality of his having missed his statutory opportunity of presenting it. But appellant's case as presented to me is that he is entitled to ignore the Commissioners and to conduct his defence before the Sheriff alone, and lead his evidence in the appeal, and as this is in my view quite contrary to both the spirit and the letter of the Act I must dismiss this appeal."

In the *Antiquary* for January is the first part of a journal of a tour through France and Italy in 1769-70 by Colonel Windham, the father of Secretary Windham. While he is liberal in his praise of foreign things, he says of the Paris of that day:—"London as a city is infinitely superior to Paris, which however has the advantage in its public buildings, churches and noblemen's houses—the entrance into it from Bois de Boulogne affords the most magnificent view that can possibly be seen. The Thuilleries is a beautifull garden; the walks well preserved, but I could not help being surprized, after so many years' absence, to find the same filth at the bottom of the walls. The inside of their houses, nasty as ever, no water coming into them but what is brought in pails from the river, and that only for the necessary use of the family. Water-closets are not to be meet with in any houses." One was fitted up in the king's apartment at the Trianon, but the colonel was told they were not approved. The château of Madrid he describes as "an old, ugly roial château at the extremity of the Bois de Boulogne, inhabited by those who have interest to get lodgings there." "Versailles," he says, "was much to be admired for the majesty of its buildings and the profusion of expence dispers'd all over the gardens in marble statues, bronzes, temples, waterworks, &c., and the trees remarkably fine." The colonel, as a soldier, admired the Invalides, which, he says, is "a building that doth honor to the nation."

LORD IVEAGH'S GIFTS.

WHENEVER strangers went a-slumming in Dublin under the guidance of a resident, they were sure to be kept in ignorance of the "Bull Alley area." They will consequently be unable to understand the courage that is required to change its character. By a curious coincidence it is to be the object of Lord Iveagh's generosity equally with the Jenner Institute (formerly the Institute of Preventative Medicine), or, in other words, it is to be improved at an expense of 250,000*l.* In one case enough microbes must have been produced to poison all Europe, and the survivors are doomed; in the other the microbes will be fostered. In Pimlico they are to be guarded as strictly as if they were jewels enclosed by Hobbs-Hart treasury doors, and they will be turned to beneficial purposes, while the microbes of the Bull Alley area have for years caused more havoc than can be readily calculated.

The area in question is almost the centre of Dublin, and if the conclusions of modern physiologists, chemists and other authorities on public health are of any value, from it must have emanated a vast proportion of the seeds of disease which have made the death rate of the Irish capital phenomenal among those of European cities. That such a state of things should arise becomes more remarkable from the position of the place. If the reader will glance at a map of Dublin, he will observe there are two cathedrals on the south side of the city. They are about a quarter of a mile apart. Their east and west sides are connected by two streets, and the intervening space constitutes what we may call an ecclesiastical island. As the streets are called after Saints Patrick, Nicholas, Bride and Werburgh, the land must at one time have formed part of the cathedral property. Two narrow lanes running east and west cross the island and bound the area which Lord Iveagh has undertaken to transform. The area may be considered as under the shadow of the cathedral buildings, but if it were in a remote part of Africa, or in the Arctic regions, it would have far more interest for the dignitaries. It has been allowed to remain one of those pestilential spots recalling the Middle Ages, where "rank corruption mining all within, infects unseen."

No wonder visitors are kept aloof from the area. They are allowed to see the fringe of it, for Patrick Street, with its booths for old clothes and other articles which have survived their age, and its rows of noisy costermongers, is accepted as a peculiarly characteristic Dublin scene. Pictures and sketches have been made of it with the cathedral for a background. But the region beyond is for the multitude an unknown land. There it was supposed the shambles for diseased animals were congregated, and part of the flesh was openly sold on the spot. In the wretched houses which seemed to have sprung up by chance, only the most miserable would seek a shelter. While the death rate was always appalling, the place was treated with indifference by the police. It was never a haunt of the criminal classes, for it was not worth risking life or liberty for the sake of a habitation in that area. Only the honest poor crept there, and amidst the surroundings death soon lost its terrors.

Although a danger to Dublin, and therefore, strictly speaking, having only a negative value, to purchase the area requires a millionaire. When the Dublin Corporation resolved to make the plague spot less noxious the large sum of 32,000*l.* had to be paid for the right to demolish a few of the structures that were hardly entitled to be called houses. Lord Iveagh proposes to spend 250,000*l.* on the purchase of sites and the erection of four blocks of model dwellings and other buildings, but any one who knows the conditions of sale in such cases will agree that his lordship will be fortunate if he can do so much for the money. It is only with the aid of compulsory regulations for the sale, based on the actual value of the premises, that the project as arranged can be realised. Sharp people will recognise they are dealing with somebody who has a hobby, and is therefore willing to make many sacrifices rather than appear to have failed. Lord Iveagh should be protected against attempts to trade on his good-nature.

Only a general notion can be given of the project, but what is proposed appears to be well adapted to the peculiarities of the case. As we have said, the place lies between two streets, Bride Street and Patrick Street, which run north and south. It is considered that two rows of buildings should have their fronts towards each of the streets. By that plan two of the four parallel blocks will face the east and two will face the west. The lower part of the block which has a frontage to the street will be arranged as shops. The risks of the unhealthy booths will consequently be avoided, and probably the trade of the streets will be changed in its character. There will also be a large lodging-house on the plan of Lord Rowton's in London, which will accommodate 500 people. As the blocks will provide room for 1,250 people, there will be no difference of numbers between the population of the Bull Alley area in the past and in the future. The majority of the habitations were low in height, and by the addition of a few storeys space can be gained without the least abstraction of the desirable superficial area from any of the tenants.

A corporation could convert an insanitary area into sites for comfortable dwellings for people who can only afford to pay a moderate rent, and in some places companies or individuals would be able to do as much. But Lord Iveagh undertakes a duty for which rates are inapplicable, and which would make ordinary investors hesitate. He intends to erect and furnish a concert hall to accommodate a thousand people, a swimming bath which can be used as a gymnasium in winter, a lecture hall which will serve for exhibitions, besides reading and classrooms. It is difficult to decide whether the provision for recreative buildings is not more desirable than model dwellings. The latter, it is true, will accommodate some 1,700 people, but the inhabitants of the district who may be supposed to take advantage of the concert hall and the swimming bath number more than 17,000. There is a river known as the Poddle beside the area, but it is prudently kept covered, for it is a filthy sewer. Bathing is no less impossible in the Liffey. The sea is at least three miles away. A place of healthy amusement is as difficult to discover as a bath. Probably one-fourth of the inhabitants of Dublin may therefore be supposed to have an interest in the contemplated recreative buildings.

The site of the mouldy buildings between the area and the cathedral has been converted into St. Patrick's Park. It was one of the members of Lord Iveagh's family who restored the cathedral. Consequently that building, the park, the recreative buildings and lodging-houses, without mentioning philanthropic works elsewhere in the city, will form a series of contiguous memorials, which will testify that the Guinnesses were the most munificent of the benefactors of Dublin.

The two cases which Lord Iveagh has made his own suggest the use which the millionaire can serve in connection with modern civilisation. In Dublin sanitation will be promoted by the new buildings, but the investigations which his lordship's money will originate through the Jenner Institute may have the effect of leading to discoveries that will revolutionise the art of healing. The consciousness of being able to exercise power to overcome evils which have baffled so many is no doubt a reward for expending half a million of money, and we hope the success of the projects will convince Lord Iveagh that his support of them is justified.

At the present time there could not be discovered a more useful application of money. Lord Iveagh might have purchased a gallery of pictures by Old Masters for the sum he is about to expend; but there are physical evils for which a sight of paintings, however excellent, is no remedy. There is, it seems to us, at the present time an excess of hope about the remedial effects which works of art can produce on the humbler classes. Apparently it is believed that paintings have superseded the old philosophies, and that a poor man has merely to look at one in order to acquire a virtuous mind. But neither philosophic systems nor great masters will lessen the ravages of bacteria. To cope with them, as with much else which causes misery in this world, defences of other kinds are needed. There is room for all aids, for the æsthetic as for the hygienic system; the mind no less than the body must be ministered to, and the scheme which is proposed for the Bull Alley improvement takes cognisance of that fact. But to make all complete in that corner of Dublin

would leave no balance for the support of the Pimlico institution. The truth is, modern civilisation is attainable only by an enormous outlay, and without the aid of men like Lord IVEAGH it is almost an impossibility. The State is burdened with imperial cares, and the charge of streets and drains is enough to exhaust the resources derived from taxes in towns.

LIMOURS.

By JOHN A. RANDOLPH.

THE quaint townlet of Limours is now reached by train starting, underground at first, from Paris from the Gare du Luxembourg, at the corner of the Rue du Panthéon and the Boulevard St. Michel, at a few paces above the Place de la Sorbonne. The country through which the train passes is full of beauty and variety when once fairly outside the suburbs, and the journey reminds us very much, both as to the vileness of the railway carriages, the innumerable curves of the line, and the grand sweeps of scenery to be met with, of that between Namur and Dinant-sur-Meuse, while the landscape is not unlike parts between Meaux and Château-Thierry, on the Epernay line. On alighting at Limours station—at present a terminus—a very few modern houses stand facing that building, backed by rising ground. On the left side as the train runs in there are some fairly-wooded hills, and the trees, which seem to block the way for the further progress of the train, afford a good screen for the surprises in store. Indeed, on alighting, the only houses in the place seem to be those in the immediate proximity of the station. So much so is this the case that on our arrival there we had to ask the way into the town. It turned out that our path lay along the lane-like tree-lined road down the hill to the left. These grand trees sheltered some huts and cottages of much picturesqueness, and the whole scene was as unlike France as any that has met our gaze.

At about a quarter of a mile away a cross road—at that juncture even more wooded overhead, but with a few ultra-French villas below the trees—turned downhill to the left, and the houses and shops began to reveal their existence.

At the bottom of the hill the road branched out and became a market-place, not over large, and quite unpretentious with regard to the architecture of its houses; but at a few yards from the church, which bounds the east side of the square, there stands the quaintest of quaint structures. At first we thought it was the local "Octroi," but on examination it proved to be the Hôtel de Ville. These curious municipal buildings are (about) 25 feet long by 12 feet wide by 15 feet high, and of course, architecturally, totally devoid of beauty and appropriateness and dignity, or harmony with the surroundings. Alongside part of the town hall is a covered market, of larger superficial area than the hall itself, and being on the same picturesque principle as that of Richelieu town, is of course vastly more pleasing to the eye.

The west front of the church is rather plain, but its gable is very acute and of noble proportions. When we saw it, some years ago, it was much in need of repai r, especially at the north corner staircase-turret. High up in the gable is a small, plain, circular window, and the west door has a very graceful shallow canopy with elongated pinnacles of the period of FRANÇOIS I. (HENRY VIII.'s time). The interior is short and wide, with no aisles to speak of, and is fitted with benches in lieu of chairs. Somehow they manage processions in the church, but obviously with much difficulty. The choir is lofty, with exquisite glass, and the fittings are bad Gothic or poor Renaissance. The church is, however, well worth a visit. The tracery is mostly uncusped, like that of St. Eustache, Paris, but Gothic in shape. There is no tower, but only a small bell-turret placed diamond-wise at the meeting of nave, choir and transept roofs.

Right against the choir walls are stables and small, hideous, modern houses, so that one cannot get quite round the church outside. This state of things is dangerous for the sacred edifice and unhealthy for the inhabitants of the houses, and it is earnestly to be hoped that those who sit in office at the Hôtel de Ville will, in the interests of all concerned and of architecture, see their way to making a clearance as imperative as it is advisable. A small avenu of diminutive trees in front of the church adds greatly tc the picturesqueness of the spot.

It was on a Sunday afternoon that we visited Limours, and the church was full to the doors. The service was the Renewal of Baptismal Vows by the First Communicants. Singing was hearty, but sadly marred by a dreadful organ—worse even than that of St. Pierre-sur-Dives.

Limours has historical associations. The château, we learn (through the courtesy of M. LE CHEVALIER LELIÈVRE), was built by the Duchess of ETAMPES in 1445. HENRI II. bought it of her, and gave it to DIANE DE POITIERS the ubiquitous, at whose orders a vast apartment, 84 feet by 31 feet, was erected by PHILIBERT DELORME. FRANÇOIS I. passed Shrovetide there to drive away the "ennui" caused him by the death of HENRY VIII. His initial "F" was carved over many of the windows.

The château was sold on April 6, 1623, to RICHELIEU, by LOUIS PONCHER (*not* by Chancellor DE CHIVERNY), soon after the statesman had secured the hat. He immediately spent a large sum of money embellishing it, erecting fountains, statues, &c., and making it a rival to the finest unfortified châteaux in the land. In 1626, however, wishing to be nearer the court when it was at St. Germain, which was only reached with difficulty from Limours, he sold it, on Christmas Eve, to GASTON D'ORLÉANS, brother of LOUIS XIII., with its dependencies (Gometz, Les Molières, Roussigny, Le Jardin), for 375,000 livres. GASTON spent a further sum of 300,000 livres on the furniture and embellishments. At his death on February 2, 1660, his widow, MARGUÉRITE DE LORRAINE, chose it for her residence. Twelve years later it passed to LOUIS XIV., and then to the Princesse DE BRIONNE. It was destroyed in 1800. It stood to the south of the church, only a few paces away, and the grounds, now enclosed by a 7 feet wall, contain a large number of magnificent trees, and a small modern lodge. There was formerly a monastery outside the town to the north-west, but at the Revolution it was suppressed and destroyed—in the name of "Liberty, Equality, Fraternity."

THE OLD UNITY CLUB.

IT is well to choose a good name for anything, and in selecting the word "unity" as descriptive of a club a felicity was secured which helped to light the road to success. The Unity Club flourished in London years back, and its history lends a distinction to the house, 281 Strand, to which Mr. J. W. Palmer has since added in many clever and interesting ways connected with literature and stamp business. Clubs are as individuals. There are your grand folks and your humble ones. In one case it is all glitter and gilding, and in the other it is all cosiness and comfort. The Unity Club aimed at the latter characteristics, as is frequently the case where men of real "grit" are concerned, who look after mental value in preference to outside display. The common-room of the Unity Club must have been a remarkably comfortable chamber, and of course was the scene of endless convivial meetings, in which joined Bohemians who have since risen to eminence, while many of course have gone to that rest in which all of us know the true unity. As the establishment 281 Strand will soon pass away, like the famous literary, artistic, musical and dramatic club so long associated with it, it is well to recall the old days, and especially while some of those whose wit and good-fellowship increased the glory of departed time are left with us. Mr. Palmer himself paid an important visit to the Unity Club about 1872, and as he entered the premises he little thought that some day he would be master of the place, and create a business which was to win a far wider renown than that achieved by the Club to which he then made his first entrance. Yet, in the chamber where he had to interview a famous member, he was to establish a museum of stamps unequalled in the wide world. When the members of the Unity Club cracked their jokes, told their tales and dreamt their dreams, the most vivid imagination among them could scarcely picture that the historic walls would in after years tell such stories of stamp forgeries and show such specimens of man's wicked ways in pictorial art, that a mere look round is enough to make us wonder why clever people are frequently so desperately iniquitous. Yet in the chamber now known as the Forgery Museum met such men as Henry Irving and J. L. Toole, before either had begun to make much impression on the stupendous world of London. No fairy then, perhaps, whispered in the ear of the master of the Lyceum that the Queen of England would make a knight

of him, while Mr. Toole could scarcely think that the hour would come when multitudes of people would inquire so anxiously about his health and eyesight, that daily papers issued bulletins. Verily there were men of genius in the Unity Club who were to stir the world. Among the members was Mr. John Hollingshead, who as manager, author and speculator has won an uncommon reputation. Though in a few years the Gaiety Theatre will disappear, the great days of John Hollingshead's management will not be forgotten, while the fact that he paid 36,000*l.* in rent to the owners of the property is well known to all who read the productions of the prolific pen of the veteran journalist. At 281 Strand also occurred a literary introduction which was to have long and lasting results. Henry Sampson here met Mr. George R. Sims. Sampson was editor of *Fun*, in succession to Hood, the beloved son of the poet who sang "The Song of the Shirt." Mr. Sims was writing verses and little stories, and finding it difficult to get editorial attention. At the Unity Club he was introduced to Sampson, and showed him some of his verses. The editor of *Fun* determined to help the young writer. Thus commenced a friendship which lasted to the death of Sampson, and to-day is a holy memory to the mind of Mr. G. R. Sims. Sampson shortly after the introduction started the *Referee*, and from the first issue till now Mr. Sims has regularly appeared in its columns. Mr. John Jolly Nash, too, the music-hall artist, was a member of the Unity, and no doubt many a night the walls re-echoed to the lively strains of "Sister Mary walked like this." The preceding are but a few of the memories of the Unity Club, now recalled, as the scene of its smiles, successes and disappointments will soon change under the wand of improvement, which has little regard for sentimental memories. Still another point to remember is that under the Museum is the well to which pilgrims came in the dim past. Its character is best suggested by the term "holy well," which name long attached to the street running from Newcastle Street to Danes Inn. But the holy well is nearly forgotten; the Unity Club has disbanded till but very few remember it, and Mr. Palmer, who has held the attention of the world so many years at 281 Strand is now leaving, as the house must go and be but an echo of the past.

SOUTH KENSINGTON MUSEUM.

THE collections of the South Kensington Museum have lately been enriched by the liberality of several gentlemen who have either lent or given their works of art for exhibition.

Sir T. D. Gibson Carmichael, M.P., has sent a varied and valuable collection. Four ivory plaques, dating from the fourteenth century, are of French workmanship, and are most delicately carved in openwork with scenes from the life of Our Lord. Two other plaques from the same set are in the permanent collection of the Museum.

Another very interesting ivory carving is the circular plaque of the Deposition from the Cross. It is probably Flemish work of the latter half of the fifteenth century; some of the figures bear great resemblance to those on the fine Brussels tapestries of that period. The tiny triangular shrine of silver, holding carved ivory figures of the Virgin and Child, with St. John the Baptist and St. Catherine of Alexandria, is decorated at the back with the subject of the Crucifixion on a dark blue enamelled ground. This little treasure is also French work of the fourteenth century. In a frame are two very beautiful portraits of Dante and Beatrice in niello; these medallions date probably from the first half of the sixteenth century and are mentioned by Cicognara in his "Memorie spettanti alla Steria della Calcografia." A flat circular reliquary of silver is also decorated in niello work, with representations of the Resurrection. There are several crystal objects in this collection, but probably the most interesting of them all is the little cylindrical reliquary of rock crystal, carved with a Kufic inscription and mounted in silver gilt of a considerably later date. An Italian rock crystal cross of the fifteenth century is mounted on gilt metal foot with two silver plaques decorated with angels in translucent enamel. At the other end of the case is a beautiful lapis lazuli cup carved in Italy in the sixteenth century; the handle is of pure gold and is in the form of a Triton with a conch. Sir Thomas Carmichael's specimens of metal work are arranged in another case, and first among them should be especially noticed the boat-shaped incense vessel of gilt copper which was formerly in the Magniac collection. It is engraved with compartments enclosing figures of St. Catherine of Alexandria and a sainted bishop. The latter was formerly connected by a copper plate attached by solder and engraved with a similar figure (probably of a successor); this has been removed, and is now fixed on the under side of the lid.

Immediately above this incense vessel is a fifteenth-century bronze of a baby from Florence. By the side of the navette is a very interesting inkstand with plaquettes by Giovanni delle Corniole, illustrating scenes in the history of Coriolanus. At the bottom of the case is an elaborate inkstand, with figures forming a group representing the martyrdom of St. Lawrence. A bronze figure of Chastity trampling on Vice is similar to one on an inkstand by Benvenuto Cellini, formerly in the Borghese collection. Some of the other bronzes are adapted from antiques which were held in high repute by the connoisseurs of the sixteenth century; notably amongst these may be mentioned a bronze head which very closely resembles the famous Medusa Ludovisi and the small figure of the boy extracting a thorn, the original of which is in the Palazzo dei Conservatori, Rome. In this collection there is a manuscript of the rules for the conduct of a school at Florence. The first page is beautifully illuminated with the Holy Trinity surrounded by angels and cherubs; within the initial letter is a figure of St. John the Evangelist. The greater portion of the scrollwork round the border forms little compartments enclosing youthful figures clad in white robes and wearing leafy crowns, probably the students of the school. The third case is filled with Sir Thomas Carmichael's terra-cotta figures from Tanagra, in Bœotia, and from Asia Minor.

Major V. A. Farquharson has lent a most interesting series of gun-locks, a complete history of this portion of a gun through all its developments from the primitive match-lock down to the most finished flint-lock used in the early part of the nineteenth century. Some of these specimens are beautifully decorated and are excellent works of art, notably three flint-locks (Nos. 63, 64 and 65) of Spanish manufacture of about 1680; they are delicately chiselled with floral ornament, monsters and demi-figures. Others are finely engraved, as, for instance, Nos. 39 and 40, made by the Zellners of Salzburg.

Another case is devoted to this gentleman's collection of firearms. Amongst them are weapons by some of the most famous armourers of the time, such as Lazarino Cominazzo, Lazro Lazarino and Caspar Zellner. There are also some specimens of the well-known Highland pistol, many of which are elaborately carved.

Mr. T. Foster Shattock has lent two large pieces of old French furniture of the sixteenth century. The first is a cabinet of walnut carved with terminal figures and with panels of architectural and other ornaments. The second is a buffet with an arcade in front and cupboard and recesses behind. The arcade is covered with an elaborate carving of terminal figures, and the drawers and panels are also carved with strap-work and masks and floral ornament. These two pieces of furniture are exhibited in the tapestry court.

A case in the south court contains Mr. Shattock's collection of small wood-carvings.

First amongst these specimens should be mentioned the seated figure of Vulcan carved in boxwood. On the shelf below are four groups of the Evangelists, apparently carved for some shrine or altar-piece. One of the treasures in this collection is the conventional lion-mask with wings on either side and horns above. In the centre of the case is a walnut panel from a French cabinet of the sixteenth century; it is carved with a figure of Minerva beneath a pedimental canopy which is surrounded by leafy stemwork and cherubs.

There are many other carvings in this case which are of great interest and show to what skill the craftsman in wood-carving could attain.

Mr. J. Fletcher Moulton, Q.C., M.P., has lent a small but valuable collection of so-called Rhodian and Damascus wares. The large mug is of peculiar interest because of its rare salmon-coloured ground, which is covered with floral decoration. The little mug with sloping side and square-shaped handle has a diaper pattern on the magnificent red ground. In the same case is a fine tall bottle painted in blue, green and red, with hyacinths and other flowers. Two fine tiles, with olive-green leaves and blue flowers, probably come from Damascus and form part of a large slab, of which the Museum already possesses three tiles.

Mr. Fletcher Moulton has also lent a small collection of metal work, including a silver-gilt bénitier in repoussé work, bearing the Paris hall mark for 1725-26, and a silver jug emblematic of Abundance, designed by J. C. Delafosse and figured in his "Nouvelle Iconologie Historique." This piece is stamped with the marks of H. Clavel, Farmer of the Duties, 1783-89. A bronze figure of Hercules of the same owner is attributed to Gian da Bologna.

Mr. Henry Wallis has lent a small collection of old Italian pottery, probably made in Tuscany before the sixteenth century. The specimens are for the most part drug vases which were used in the pharmacies attached to monasteries and houses of noble families. This collection is very valuable to the student of Italian majolica, as it illustrates very well the beginnings of this art, which was to culminate a little later on in the magnificent wares in which the Museum is so rich.

During this month the section of textile fabrics in the Museum has received a most important and interesting gift from Miss Smithies and Mr. W. T. Smithies, of Manchester. This lady and gentleman have greatly interested themselves in the manners and customs of the inhabitants of Peru before the

Spanish conquest in the sixteenth century. Mr. Smithies has recently arrived from Lima, and has brought with him a very large collection of objects taken from the graveyards in the neighbourhood of that city. In this collection were many fragments of robes and shrouds; these he has given to the Museum, and they are now temporarily on view in the tapestry court.

The work closely resembles in execution the garments which have been found at Akhmin, in Egypt, inasmuch as some are decorated with tapestry work and others in embroidery. The garments, however, from Peru are made of cotton, whilst those from Akhmin were for the most part of linen; the decoration in both cases is of worsted. The patterns of both series bear a certain resemblance to one another. The Museum did not possess before any of these fragments, and the thanks of all are due to Miss Smithies and Mr. Smithies for this very interesting collection, which forms a most valuable link in the history of the textile craft.

The Museum has just acquired a small but very interesting collection of newel posts; they have been obtained at Brussels and come from houses of the last century which had recently been demolished.

The posts are for the most part of oak and are carved with the ornament usually seen on woodwork of that period, such as festoons, rosettes and acanthus leaves. These newels must have been the ordinary form in use on staircases in houses in Brussels, as the museum in that city possesses quite a large collection of them. These specimens of house decoration are exhibited in the furniture corridor.

AN ARCHAIC CHARIOTEER.

THE situation of Delphi, says a correspondent of the *Manchester Guardian*, is one of the most striking and sublime in all Greece; it lies in the narrow vale of the river Pleistos, being bounded on one side by Mount Parnassus and on the other by Mount Kirphis. Shut in on all sides from the rest of the world, it could not have been seen by any of the numerous pilgrims who visited it until they had crossed one of its rocky barriers, when all its glories would burst suddenly upon their view. For centuries past these glories had been hidden by decay and ruin and the superimposition of the soil and débris incidental to rough human occupation. Thanks, however, to French excavations of its site, carried on for many years at vast expense, the rejoicing traveller who remembered it in its time of disfigurement and desolation may now find enough of recovery and restoration to suggest to him the natural and acquired splendours of the place at the period when the treasures of its temple attracted the cupidity of the divinely discomfited Xerxes. After negotiations extending over four years, the French School at Athens obtained in 1891 a ten years' concession from the Greek Government of the right to excavate the site of the famous sanctuary of Apollo, then covered with the modern Greek village of Castri, whose inhabitants had to be bought out as a necessary preliminary to the excavations. Another village, nearly a mile distant from their former homes, had also to be built for the accommodation of the people so dispossessed. The excavations have resulted in discoveries of extraordinary interest, mostly of objects which throw light upon the art and life generally of the remote period before the Persian wars. The appearance of the broad Sacred Way, which winds circuitously to relieve the steepness of the acclivity from the gateway up the hill is now, as restored by the taste and industry of the French, and as compared with memories of the same site before the operations, at once a delight and a marvel. Its pavement of large rectangular slabs and its other treasures, including at its lower extremity the semicircular bases which bore the statues of early Argive kings, are now again suggested, if not completely revealed, along with the marble seats with which it was flanked for the accommodation of aged or other infirm persons who desired to witness the processions on their way to the Temple. The reward of the French explorers, by a compact akin in its conditions to those which characterised an analogous concession to the Prussian Government with regard to Olympia, consists chiefly of casts and photographs, the originals of which are preserved *in situ*, unless a chance discovery of duplicates should entitle them to the appropriation of one of the originals. How large these may still be for the recompense of fortunate discovery, and in spite of the ravages of time and other despoilers, may be understood from the circumstance that in its heyday a visitor entering the sacred enclosure from the eastern side would find his attention first attracted by the all but countless statues of athletes and other dedicatory offerings. Even in Pliny's time they numbered not less than 3,000, and Nero alone is said to have carried off 500 bronze statues. One of those which he did not take away remained to be unearthed in the course of the French excavations, and a cast of it from the bronze original has just been presented by the French Minister of Public Instruction to the Trustees of the British Museum, in the Archaic Room of which it is now appropriately exhibited. It is a full-length statue, being over 5 feet 10 inches in height, of a charioteer, whose youthfulness is indicated by the slightness of the budding whiskers, which are scarcely more than a suggestion; and whose features, notwithstanding that they are the counterfeit presentment of what was flesh and blood nearly 2,400 years ago—the era of production ranging between 482 and 472 B.C.—including the somewhat full lips, sub-sensuous but not unrefined, might be seen exemplified amongst the young manhood of the Hellenic cities of the present generation. The hair is close, crisp and curly, lying flat on the head as if under a skull-cap, and is confined by a fillet loosely tied behind, from which short straggling curls emerge between the temples and the forehead. The figure is perfectly erect and reposeful, as if not yet affected by the stress and excitement of the race, which would seem to be not so much begun as on the eve of beginning. The feet, which are close and parallel to each other, "toe," so to speak, the same line, neither being in advance of the other. The right arm, which alone of the upper limbs continues perfect, is held out horizontally and at right angles to the body of the figure, and the right hand and the fingers of the same are vividly calculated to suggest the holding of the rein which had once been under manipulation; whilst the direction of the stump of the left arm, which is truncated halfway between the shoulder and the elbow, indicates the holding of another rein by the hand which is no longer extant. In conformity with the art conventions of the place and period, the dress of the charioteer is that of a girl or woman, whose long chiton or tunic from the girdle downwards falls at once limp and corrugated to within 6 inches of the ground, so exposing the ankles as well as the feet. It is the combination of the minute gracefulness of the archaic times before the period of Pheidias with the extraordinary vitality of the feet and the right arm and hand that actually imparts to these extremities a life-like character which it would be difficult to rival by anything in the Parthenon. Fragments of the horses were found with the statue, as well as an accompanying inscription of two lines in verse. These lines are incomplete, but the name occurs of Heiron of Syracuse, and this identifies the charioteer as having been concerned victoriously in a race in which the munificent Sicilian king was interested, and which may have formed the subject of an ode by Pindar or Bacchylides, of both of whom Heiron was the patron.

DEMOLITIONS IN VENICE AND FLORENCE.

THE late Italian correspondent of the *Times* writes:—The interest shown by the English public in the question of the Florentine demolitions induces me to offer you a brief history of the precedents of the ways and works amongst antiquities in Italy which may perhaps contribute to a more intelligent use of the moral influence Englishmen always have in Italy if they do not cross too much the grain of public feeling of the Italians. The demonstrations of interest in the old buildings in the peninsula by us have not always been such as to conciliate that feeling, and it is beyond question that the denunciations of Italian operations have sometimes had precisely the opposite effect from that intended, because they were uttered in ignorance of the circumstances. At present we have two important objects of interest—the operations at Florence and the Ducal Palace at Venice—with regard to which we are in danger of confusing judgment and wasting our sympathy. Nearly twenty years ago we had a similar crisis on the same grounds, and as I was, as some of your readers will remember, *magna pars* in the very bitter controversies which arose, perhaps I may be of use in putting things clearly and saving words and ill-feeling.

At that time the subjects of controversy were the Ducal Palace and St. Mark's, and the restorations of the Duomo in Florence, the latter followed a little later by the expurgation of the centre in the same city. I will consider them separately and in that order. The restorations on the Ducal Palace and St. Mark's were a continuation of those begun by the Austrians in 1840, and were indispensable to the stability of the buildings in question. Both had been disfigured by balks of timber which concealed in great measure the architecture, and the inevitable fate of both was to fall into the Piazza in masses of ruin if something were not done to strengthen the substructures. I then defended, and not unsuccessfully, in the *Times*, the work being done in Venice, against the denunciations of William Morris and his friends, who, it seemed to me, preferred to see St. Mark's a picturesque heap of ruins and the Ducal Palace tumbling into the Piazzetta, to seeing them restored to their original design. My defence of the work on the Ducal Palace conciliated the public feeling in Venice, and the work was carried on with even general foreign approbation until the south and west façades were restored to their original.

appearance and given a solidity they had never possessed when new. The eastern wall, that toward the Bridge of Sighs, was then settling and cracking in the most menacing manner, and was shored up and the arches filled with timbers to prevent its total collapse, until the architect of the other restorations should be free and provided with funds for its restoration. At this moment the crisis came on, the local jealousies of the architects came in, and old Vendrasco, the master workman of the Ducal Palace, was dismissed to make way for the architect of the municipality, the restorer of the Fondaco dei Turchi, the ghastly monument of his own incompetence and the barbarous taste of the Venetian municipality, and the Ducal Palace remains in statu quo, the whole eastern façade sinking into the narrow canal. The good work done was to the credit of the Ministry of Public Instruction, the stoppage and incompetence to that of the municipality, as has generally been the case throughout Italy, where incompetence and corruption find their warmest nest in the municipalities. Meanwhile, St. Mark's, restored, as far as is humanly possible, to its integrity, is sinking en masse into the mud, and until it disappears will delight the world.

The case in Florence was entirely different. The centre, a conglomeration of old and historical houses with accretion of slight and more or less substantial structures of succeeding centuries, a picturesque but insanitary huddle, full of corners for a painter and provocations of disease, demanded sanitation and demolition. Such houses as had a genuine historical value were ultimately isolated and preserved, but the filth and dilapidation cleared out. The artists howled, but common sense approved. But, on the other hand, the completion of the façade of the Duomo was near, and offered a temptation to the municipality to offer a spick and span new cathedral to the public gaze, and scaffolds were erected to hide the work, while the workmen washed the sculptures of the Pisani and their contemporaries with strong acids until the old weather-toned surfaces were eaten away, when the marble-cutters rechiselled them, and would, had they not been interrupted, have given us a cathedral as bright and new as a bridecake against the day of the unveiling of the new façade. To this end the municipality and population urged with all their enthusiasm, and with a taste and ambition which reappear in the intention to demolish the Ponte Vecchio, and cut some fine new streets through the most historic quarter of the city. At that moment a friend, the editor of the *Cornhill*, asked me for an article on the Italian restorations, and I recounted what they were doing to the Duomo, with the result that the article fell under the notice of the Ministry of Public Instruction, and a telegram suspended all work on the Duomo. A provision of Italian law, which might well be imitated by other countries, puts all buildings declared to be public monuments under the custody of the Ministry of Public Instruction, and makes them inviolable until a Ministerial order is issued for any work necessary to preserve them.

The proposed operations in Florence fall in both categories of work—the Ponte Vecchio and all the buildings on it were, notwithstanding all the denials of to-day, proposed for demolition as long ago as when I was in Florence, on the ground that the piers of the bridge obstructed too much the flow of the river, but really because the municipal taste of Florence preferred a graceful suspension bridge, and somebody saw a job, probably. The Ponte Vecchio was easily declared a public monument and intangible, as I have reason to believe it has been. I have personally been instrumental in preserving several important structures from destruction by pointing them out to the Ministry as intended for demolition or restoration, as notably the exterior pulpit of Donatello at Prato, which was scaffolded for renewal on the lines of the renovation of the Duomo of Florence and the garden of the British Embassy, and any intelligent traveller who finds an ancient structure menaced with destruction would render a similar service to the Ministry by calling its attention to the danger. But the new streets which it is proposed to cut between the centre and the Ponte Vecchio cannot be prohibited by the Ministry, except so far as historical houses may be menaced with demolition. The proposed works are absolutely senseless and are only required by the crude desire for modern improvements, and the taste which ordered the renovation of the sculptures of the Duomo, for the prevention of which I was at the time cursed by nearly the entire population of Florence. I fear that no pressure on the tasteless municipality will prevail, unless it be so loud and so long as to startle it into some sense entirely novel of the existence of an outer world which is important to the prosperity of the city. When we can make the Florentine shopkeepers understand that they are going to drive foreigners away from Florence with their renovations we shall put a weight on their consciences. An appeal to the royal Government made by the Italian signers of the remonstrance against the needless expenditure by a lately and still practically bankrupt city might weigh, but I fear there is no hope to be based on the good taste of the majority of the population or the municipality it has elected.

DUNFERMLINE ARCHÆOLOGICAL SOCIETY.

THE session of the Dunfermline Museum and Archæological Society was opened on the 19th inst. by Mr. Macgregor Chalmers, who delivered a lecture in the museum, Carnegie Library Buildings, on the "Abbeys and Cathedrals of Scotland." Mr. Beveridge, the president, occupied the chair.

Mr. Chalmers carefully traced not only the evolution of the general plan of our ancient ecclesiastical foundations, and the development is very clearly to be noted in Scotland before the inflow of the Norman art at the end of the eleventh century, but he also traced the gradual changes which took place in the decorative details of the structures from the earliest times until the Reformation. Towards the close of the lecture an earnest appeal was made for more careful examination of the charge of demolition of the sacred edifices laid against the Reformers. Many illustrations were given where the buildings themselves proved that the charge was false. In the case of Dunfermline Abbey it was shown that whilst, from some cause not clearly known, the abbey buildings had been in part ruined about the time of the Reformation, not many years later very large works of repair were carried out, the evidence of which still remained. A better understanding of the Reformers' true attitude towards the ancient and beautiful fabrics would doubtless lead to a more widespread attitude of sympathy towards those who called for a larger and more generous spirit of sacrifice in the desire to have the House of God made more worthy of its sacred purpose.

At the close of the lecture Mr. Chalmers was awarded a cordial vote of thanks.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE following prizes have been awarded by this Society:—The Hon. President's prize for three designs—P. E. Nobbs; the summer's work prize, presented by J. A. Morris—J. Hervey Rutherford; the President's prize, façade design—Ramsay Traquair; the Vice-President's prize, entrance gates design—P. E. Nobbs. The following office-bearers have been elected for the year:—President, Mr. A. Lorne Campbell; vice-president, Mr. Alfred Greig; treasurer, Mr. John Matthew; librarian, Mr. T. A. Patterson; joint hon. secretaries, Messrs. P. E. Nobbs and Andrew Muir.

TESSERÆ.

Eastern Monasteries.

NO one will pretend to compare on the whole the monasteries of the East with those of the West—the influence of the former, whether we look to religion, to literature, to science, to art, or to the political arrangements of society, has been very inferior to that which all historians recognise in the other case. But still the Eastern monasteries deserve more attention than has fallen to their share. Their troubled history too well explains why, from a very early date, they all assumed the character of fortresses. Everywhere, from the morasses of Moldavia to the cataracts of the Nile, from the vale of the Peneus to the mountains of Kurdistan, they have been and are castles. Sometimes they are found hanging like birds'-nests or bee-hives on some shelf in the face of an enormous precipice, accessible only by pulleys or ladders. Not uncommonly they occupy the summit of an isolated pillar of rock rising hundreds of feet sheer from the pass. In flat regions, where violence has been rife, as in Egypt and Mesopotamia, the whole is enclosed within a high dead wall—with no windows outwards, except perhaps in some wooden gallery or wicker cradles that top the massive battlement, and may be removed with ease, or destroyed without serious inconvenience. If by such means they can baffle external assault, their own hereditary feelings insure a most sacred watch over whatever is enclosed within, and can be in any degree appreciated by the community. If a chapel, a refectory, even a kitchen or a cellar requires repair, it is restored with the most anxious precision, and all trace of the modern hand is very soon indistinguishable. It is the same with every painting—a careful pencil is always ready to freshen the least spot of decay or dimness—and such as they were a thousand years ago or more, such are they at this hour. The artists are servilely mechanical—they have sets of rules many centuries old, with pattern tints for every object of detail, and by these they guide themselves from generation to generation, as scrupulously as if the most serious duty of religion were concerned. Their shrines, reliquaries, chalices, every article in metal, the carved and embossed frames of pictures and boards of holy books, have in many instances come quite unharmed through all the chances of twelve centuries. The MS. charters and books themselves are often of equal antiquity, and but for the unhappy device of the

palimpsest and the utter ignorance of the more modern monks, we might not unfairly hope for the recovery among their tranquil shelves of all those treasures which were accessible, it seems as but yesterday, to the grammarians and epitomisers of the Byzantine school.

Gold and Silver.

Various alloys will bear various degrees of bending, hammering and drawing through successively diminishing wire plate holes; after which, if you drive them to extremities, the wire snaps, the lump bursts and the strip cracks. But if, before these recalcitrant phenomena supervene, the metal is annealed, it will undergo afresh just as much hammering, bending and drawing as before. The snaps of clasps are hammered thus to what is called "a spring temper." Hamlet's "unannealed," as applied by the ghost to the unprepared state of his spirit, is a metaphor taken from the potteries. Annealing in that trade means preparing by gradual heat to be put into the furnace without danger of cracking. Workmen call it "nealing." Persons whose only acquaintance with metal-work is derived from the blacksmith's shop, naturally imagine that the precious metals are forged like iron during red heat. On the contrary, gold and silver are brittle during heat. The ductility, pliancy and malleability of these metals depend on the squeezableness of their particles when cold. Though matter be impenetrable, pressure can not only wedge the granules together as closely as their shape will allow, but by modifying the shape of the granules may render them more packable. Just as in a hive, the naturally cylindrical cells are by mere collateral pressure (without any mathematical design on the part of the little architects) squeezed into hexagonal tubes. Heat probably expands the separate granules into their normal shape—to admit of which process their cohesion must be somewhat relaxed—hence, perhaps, the brittleness. The peculiar malleability of iron and platinum under heat is due, probably, to a capacity for a sort of sluggish semifusion, as is seen in welding, when the metal surfaces unite without the intermediation of solder.

Reynolds and Bonomi.

In 1790 Sir Joshua Reynolds was anxiously desirous to procure the vacant professorship of perspective in the Royal Academy for Bonomi, an Italian architect; but that artist not having been yet elected an associate was of course no academician, and it became necessary to raise him to these situations in order to qualify him for being a professor. Gilpin being his competitor for the associateship, the numbers on the ballot proved equal, when the President by his casting vote decided the election in favour of his friend, who was thereby advanced so far towards the professorship. Soon after this an academic seat being vacant Sir Joshua exerted all his influence to obtain it for Bonomi, but finding himself out-voted by a majority of two to one, he quitted the chair with great dissatisfaction, and next day sent to the secretary of the academy a formal resignation of the office which for twenty-one years he had filled with honour to himself and his country. His indignation, however, subsiding, he suffered himself to be prevailed upon to return to the chair, which within a year and a half he was again desirous to quit for a better reason.

Da Vinci and Modern Art.

Vasari designates Leonardo da Vinci as the founder of a manner which he agrees to call the "modern manner." The terms sound strangely misplaced as applied to a painter who came into the world above four centuries ago. Yet, if we consider, we shall find the real line of demarcation between a period in art which went before him, and another which is not gone yet, to consist in his works. We must not look at his "Vierge aux Rochers," beautiful as it is, for that still belongs, with its fantastic background, to a foregone mode of conception. We must rather point to the great "Last Supper," familiar to every cultivated eye by the fine engraving, and of which we possess the best version in the world in a contemporary copy by Marco d'Oggione, one of his pupils, which belongs to the Royal Academy. What is there in that "Last Supper" which we do not aspire to still, or which we have in any way outgrown? What is there that is crude, peculiar, or old-fashioned? What beauty that it does not develop, or what promise that it does not fulfil? It remains still the type of just conception, glorious drapery, faultless expression, and, we have no doubt, originally exquisite execution. It is the "moderna maniera" still, and there is nothing new to us in it to this day except its excellence. This great work, which, in its original elements, has long perished from off the face of the convent wall, but the arrangement of which every English child of average observation knows by heart, was completed about the year 1495, in the prime of his manhood, when Michel Angelo was twenty-one, Titian eighteen, Raphael twelve, and Correggio one year old. Who shall limit what it has done for the world? The time is past when pictures by Leonardo da Vinci are talked about at every corner, as if he were to be had, like any other master, for money. Nevertheless, there is one period of his unceasing activity which has never been satisfactorily accounted for in his works—when he ceased to be the scholar and had not begun to be the master. All writers repeat the tradition of his scholarship having terminated with the painting of the angel in Verocchio's picture of the "Baptism of Christ." It would be hard to assign the precise date of that event, but there can be no doubt that a genius so advanced, and, like all such, far less fastidious in youth than in riper years, must have thrown off many a picture between the days of his pupilage and the age of thirty, when he removed to Milan. Although, therefore, as Nagler observes, "it would be difficult and daring to point out works belonging to that time," yet there is much probability in Waagen's conjecture that certain pictures miscellaneously ascribed to his scholars, or, in cases more wide of the mark, to other masters, were executed by Leonardo da Vinci himself in this intermediate period.

The Temple of Jupiter Serapis.

The remaining columns of this temple exhibit a very remarkable appearance. Three pillars 42 feet in height, up to about 12 feet above their pedestals, have the surface of the marble as smooth as any in the Forum, then comes a portion of 9 or 10 feet of which the marble has been bored, drilled in all directions, by that persevering bivalve the *Lithodomus*; the perforations are so considerable and go so deep as to prove "the long-continued abode" of these animals within the stone, and by consequence, as Lyell observes, "a long-continued immersion of the columns in the sea at some period recent, comparatively, with that of its erection." Indeed, there is abundant evidence adduced in his "Geology" to show that all this ground was at a no very distant period under the sea, like Monte Nuovo in its neighbourhood, and was thrust out of the water to its present level. When the ground on which this temple stood collapsed, the bottom part of its columns was protected by "the rubbish of decayed buildings and strata of turf," the middle or perforated part was left exposed to the action of the sea bivalves above alluded to, and the upper part, which was never under the water, remained smooth and free from perforation. But these columns not only prove by internal evidence the general fact of the ground on which they stand having been submerged—they also furnish an exact measure of the degree to which it sunk, viz. 20 feet—*i.e.* the height where these perforations terminate at present. One can only cross the floor of this building on stepping-stones, and shoals of small sea fish are seen darting about in the shallow water which occupies its area, into which the sea has been admitted on purpose to prevent the accumulation of the stagnant water that had infected this particular spot with intense malaria.

Mind's-Eye Views of Greece.

Superb scenery is exhibited by a view from the mountains Olympus and Ossa. The great Olympian chain forms a line which is exactly opposite to Salonica, and even the chasm between Olympus and Ossa, constituting the defile of Tempe, is here visible. Directing the eye towards that chain there is comprehended in one view the whole of Pieria and Bottiæa, and with the vivid impressions which remain after leaving the country, memory easily recalls into one mental picture the whole of Greece. Every reader may not duly comprehend what is meant by this, but every traveller who has beheld the scenes to which allusion is made will readily admit its truth; he will be aware that whenever his thoughts were directed to that country the whole of it recurred to his imagination as if he were actually indulged with a view of it In such an imaginary flight he enters, for example, the defile of Tempe, and as the gorge opens to the south he beholds all the Larissian plain. This conducts him to the fields of Pharsalia, whence he ascends the mountains south of Pharsalus; then, crossing the bleak and still more elevated region extending from these mountains towards Lamia, he views Mount Pindus far before him, and descending into the plain of the Sperchius, passes the straits of Thermopylæ. Afterwards, ascending Mount Œta he beholds opposite to him the snowy point of Lycorea, with the rest of Parnassus and the villages and towns lying at its base; the whole plain of Elataia lying at his feet, with the course of the Cephissus to the sea. Passing to the summit of Parnassus he looks down upon all the other mountains, plains, islands and gulfs of Greece, but especially surveys the broad bosom of Cithæron, Helicon and Hymettus. Thence, roaming into the depths and over all the heights of Eubœa and Peloponnesus, he has their inmost recesses again submitted to his contemplation. Next, resting upon Hymettus, he examines, even in the minutest detail, the whole of Attica to the Sunian promontory; for he sees it all—and all the shores of Argos, Sicyon, Corinth, Megara, Eleusis and Athens. Thus, although not in all the freshness of its living colours, yet in all its grandeur, doth Greece actually present itself to the mind's eye—and may the impression never be obliterated.

NOTES AND COMMENTS.

The venerable saying, "There is nothing new under the sun," is again verified in the case of acetylene gas. It is commonly supposed to be a discovery of our time. But Professor Vivian Lewes has shown that more than sixty years ago (March 1836) it was described and its properties demonstrated by Sir Humphry Davy's brother, Edmond, who was professor of chemistry to the Royal Dublin Society. He brought the subject before a larger audience in the same year, for at the Bristol meeting of the British Association he read a paper upon it and the method of production, showing that when the metal potassium was made by heating a mixture of calcined tartar and charcoal in a large iron bottle, a black substance was frequently formed which was readily decomposed by water and yielded a gas which we now know as acetylene, but which he at that time christened bicarburet of hydrogen. It was in this paper that the author pointed out that from the brilliancy with which the new gas burnt in contact with the atmosphere it was admirably adapted for the purpose of artificial light if it could be produced at a sufficiently cheap rate. The name of the gas afterwards was "klumene" and then "acetylene." It had, however, no commercial interest until calcic carbide could be produced at a cheap rate, but as the gas is now easily obtained it has a great future in connection with lighting.

The Baroness Hirsch having presented 2,000,000 francs to the Institut Pasteur, the Council resolved to erect an annexe for biological studies. It is practically equivalent to an additional institut. The work was entrusted to M. Brebant, who has proved his competence by the beautiful memorial chapel as well as by the thoroughly efficient ranges of laboratories, consulting-rooms, &c. Efforts are being made to have the new buildings completed by the end of 1889. During the exhibition year many foreign physicians and surgeons are expected to visit Paris. Arrangements will be made to enable them to understand all the operations and experiments which take place at the Institut. The new buildings, of which M. Duclaux will have charge, will be used for several interesting congresses.

It was supposed that the memorial of Charles Garnier would consist of a reproduction of the bust of the architect surmounting an ornamental pedestal or other support. In fact, M. Pascal has made no less than eight designs for a memorial of that kind. Owing, however, to the liberality of the subscriptions, it is considered that a larger sum of money will be at the disposal of the committee than was anticipated. There is consequently a desire that a statue should be commissioned. There is a portrait of the architect by his friend, Paul Baudry, which would serve a sculptor's purposes, especially as Charles Garnier was well known to many sculptors. But a statue revives the difficulty of obtaining a suitable site, for Charles Garnier would not approve of one being placed in front of the Opera House, and a position at the side of the building is better adapted for such a memorial as was originally contemplated than for an isolated figure in marble or bronze.

Several portraits have recently been presented to the National Portrait Gallery. One is a small bronze bust of Prince Charles Edward Stuart, on a porphyry pedestal, brought from Italy in the latter half of the eighteenth century by Edward King, the antiquary. It was presented by Mr. William Aldis Wright, vice-master of Trinity College, Cambridge. The second is a small portrait painted in oils by Samuel Laurence of Jane Welsh Carlyle, the wife of Thomas Carlyle, presented by Major-General J. B. Sterling. A pen and ink sketch by W. Behnes, the sculptor, of Sydney, Lady Morgan, was presented by Mr. F. Draper. A portrait of Alexander Pope, the poet, painted by Sir Godfrey Kneller, was given by Mr. Alfred A. de Pass. A cast from a posthumous bust by Francis J. Williamson, of Alfred, Lord Tennyson, is a gift of the artist. The Rev. Francis Warre has given a small portrait in oils by E. Beresford of William Carr, Lord Beresford. The trustees have purchased a portrait of Admiral Sir George Rooke, K.B., the captor of Gibraltar, painted by M. Dahl, and a portrait of Joseph Mallord William Turner, R.A., drawn in coloured chalks by Charles Turner, the engraver.

At the beginning of the century the church of Malmesbury Abbey was one of the most neglected of the English Mediæval buildings. Carter was told when he visited it in 18c2 that it was not cleaned during ten years, and he was able to testify that "the accumulation of rubbish in the aisles and pews was not only great but offensive." The south aisle was used as an engine shed. In an architectural sense the abbey is interesting, for if we may draw an inference from what William of Malmesbury wrote, it was one of the earliest examples in this country of fine pointed masonry. He tells us that the courses of stone were so correctly laid as to cause the spectator to imagine the whole wall was a single block. From time to time efforts have been made to restore the building, but time is not to be kept inactive and the need of further works is urgent. At a recent meeting the vicar, the Rev. G. W. Tucker, proposed that the necessary works should be divided into three sections. In the first section will be comprised whatever is necessary to put the part of the present building used as a church into a thorough state of repair, the cost being roughly estimated at from 5,000*l.* to 6,000*l.*; the works of the second section are intended to prevent the ruined parts from falling into further decay, the approximate cost being 5,000*l.*; while in the third, if funds permit, will be the rebuilding of the three ruined bays of the nave at a further probable cost of 10,000*l.*

The present Minister of Fine Arts in Italy, Signor Baccelli, is an enthusiastic lover of archæology, with a predilection for the Forum Romanum in Rome. Apparently, he is desirous to have his name associated with that memorable spot. If funds were to be obtained he would not only continue excavations in the most systematic manner, but bring together all the remains which are now scattered through the city although originally derived from that centre of Roman greatness. A special commission has been appointed by him to investigate and report, with Signor Boni, the architect, as the guiding spirit. Explorations have been commenced at the Ædicola in the Via Sacra. In the Temple of Vesta a subterranean passage was discovered of which the purpose is not clear. Alongside the Basilica Giulia was at one time a row of statues on pedestals, and the Minister has had a view prepared to suggest the appearance of that part of the Forum. At the site of the temple dedicated to the "divus Cæsar" the remains of a pedestal were discovered, which is supposed to have formed a part of the memorial erected where the body of the dictator was cremated. The evidence of a medal would prove there was a great statue of Cæsar in the portico of his temple.

In a letter to one of his daughters, dated June 1859, Charles Dickens, who was then engaged in improvements on his little estate at Gadshill, wrote:—"One of the balustrades of the old Rochester Bridge has been (very nicely) presented to me by the contractors for the works, and has been duly stone-masoned and set up on the lawn behind the house. I have ordered a sundial for the top of it, and it will be a very good object indeed." At the sale of the property the sundial became the property of a Mr. Creighton, of Rochester, who set it up in his garden, and had the following inscription engraved on the column:—"These relics from Gadshill Place and old Rochester Bridge are placed here in sincere regard for Charles Dickens." Although in a legal sense the column and dial should be considered a fixture, they appear to be destined to a wandering existence. They were sold by auction in London a few days ago for 50*l.* 10*s.*

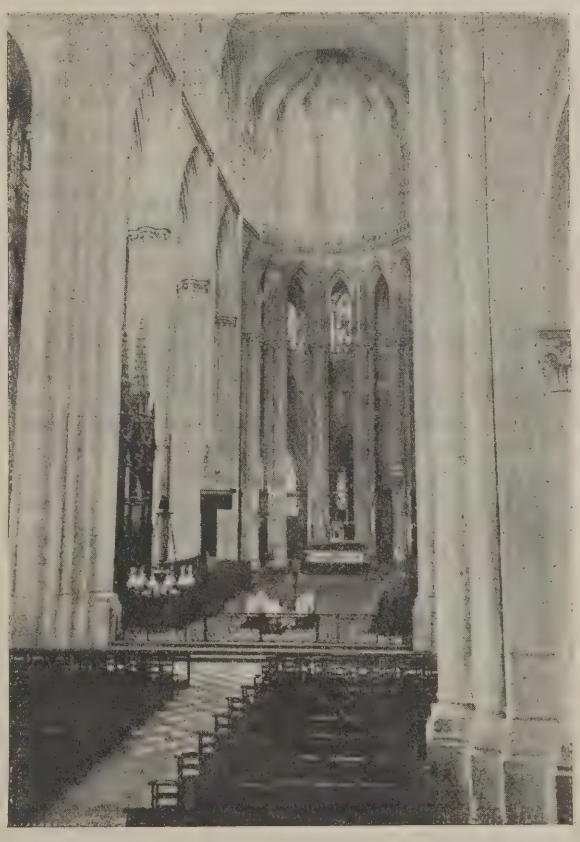
VII.

Le Mans and Tours.

DEJEUNER concluded, we bethink ourselves of going to the cathedral to hear the afternoon offices, and shortly before two start off; but after sitting in the nave for more than half an hour, and not a singing man or canon putting in an appearance, we quit the church for a country ramble among the English-looking lanes bordering the river. Evidently the matutinal and postprandial offices are not sung at Le Mans.

Just as we leave the outskirts of the city we are overtaken by a funeral procession on its way to the cemetery. So intense is the afternoon heat that the tapers carried by the little acolytes on either side the silver crucifix are describing elongated semicircles, while the long train of followers, mostly women under umbrellas, are "lagging, tired with the length of the way," like the 200 ladies at Anne of Denmark's funeral, "a drawling dolorous sight."



Le Mans: Interior of Notre-Dame de la Couture.

Rambling on without any definite object in view, we arrive shortly at some picturesque mills—the Bishop's Mills—situated on the Sarthe, and approached from the road where we now are by a wooden bridge, on which stands a prepossessing café. Keeping this house of entertainment in our mind's eye, we cross this bridge and continue our ramble along the road bordering the opposite bank of the Sarthe, whose verdant meadows fringed with polled willows invite repose. Another short walk and we reach the small village church of St. Pavage—a mere barn, like some of the little old Welsh chapels, but striking from the contrast it offers to the soaring choir of the cathedral, plainly seen athwart the trees from the peaceful little "God's acre" where we sat to rest awhile. The return walk to Le Mans is agreeably broken by a bath and a brisk walk back to the rustic balconied café, whence the view looking up the river terminates in the long, low Romanesque nave and lofty choir of St. Julien. The situation is really so enchanting that we bespeak a *déjeuner à la fourchette* for the next morning, intending to bring our books and writing materials, albeit we had intended quitting Le Mans at an early hour for Tours, but as we have no one but ourselves to consult, we are able somewhat to adopt Montaigne's method of proceeding:—"S'il fait laid à droite, je prends à gauche; si je me trouve mal propre à monter à cheval, je m'arreste. . . . Ay-je laissé quelque chose derrière moi, j'y retourne: c'est toujours mon chemin, je ne trace aucune ligne certaine, n'y droicte n'y courbe."

Another delightful walk through lanes with blackberry-laden hedges brings us back to Le Mans just in time to see the sun dye with gorgeous hues the delicate shafts of the choir arcade, leaving the matchless double aisles in a profoundly awful gloom.

The first item in the programme of our second day at Le Mans is a visit to the singular church of Notre-Dame de la Couture, *i.e.* de cultura Dei. In the stillness of early morning several Low Masses are being celebrated here. A very largely attended one is going on in the chapel opening out of the south transept. In the one opposite there is no congregation whatever beyond an old woman. The chasubles worn are black and of board-like appearance, the same colour we find being used at St. Julien des Près, so we presume that these are *Messes des Morts*. At the subsequent Canons' Mass at the cathedral the celebrant and his assistants are vested in violet for the Vigil of St. Laurence.

Le Mans Cathedral: the Choir.

Although it has suffered grievously from injudicious restoration, Notre-Dame de la Couture presents many features of more than ordinary interest. We will take the interior and the oldest part of the interior first. This is the choir, which, like that of St. Julien des Près, loses much of its real height from the presence of a crypt which runs under it in its central portion, and at the top of whose steps stands the high altar, just under the arch leading into the choir. The encircling arcades are very simple and severe, strongly recalling our St. Bartholomew's

Smithfield, and St. John's Chapel in the White Tower. The true height of the plain round columns can only be seen from the choir aisles, whence, right and left, steps descend into this crypt, which receives partial light from some windows "giving" on to the choir aisles, it not being thoroughly subterranean. The Romanesque windows of the choir clerestory have been replaced by Decorated ones, filled with questionable stained-glass—a great blemish on this otherwise perfect interior. The high altar at La Couture, standing, as we said above, at the summit of the crypt steps, and therefore attaining an air of unusual dignity and importance, is of modern Byzantine workmanship, and has in lieu of antependium a row of small figures within arcades. Behind the tall crucifix and candles, all carrying out the same design, is a low reredos with arcaded figures. In the space behind are the choir-stalls and organ.

The circumambient aisle chapels are, many of them, very beautiful. Singularly, the eastern chapel is square-ended. It is Early Decorated, and has an east window of four lights filled with good, bright, modern stained-glass. The side windows are of two lights.

Perhaps the gem of this church is the chapel of the Sacred Heart in the north ambulatory, from which the most fascinating views are to be had across the choir and transepts. Here is a large Renaissance baldacchino of modern design. From the pendant bosses of its three arches hang lamps, three from the central and two from each side arch—seven in all. Another interesting feature is the presence of some red brickwork in the arches of this circumambient aisle, not profuse, but just sufficient to give a touch of colour here and there. The Romanesque transepts seem to have been much cut into during the Decorated periods, the face of the northern one being lighted by a very tall six-light window with wiry tracery, German or Flemish rather than French in its character, and a large Decorated chapel has been thrown out on its east side, containing a reredos—a perfect mountain of modern Italian Renaissance. The west side of the altar is worked in black and white marble, looking at a distance something like a frontal. The opposite transept and its chapel is poor Late work.

To this apsidal choir and transepts a broad nave of the Angevine type succeeds. It is divided into three wide bays by clusters of attached shafts, from which the main ribs of the waggon-shaped and vaulted roof spring. There are no aisles, but the walls are relieved in their lower part by broad blank arches, above which is a clerestory of coupled lancets nobly shafted, and having in the containing arch a circle, in the western bay, cusped. A finer type of nave for congregational purposes can hardly be imagined, and it is interesting to find such an example so far north as Le Mans. In the neighbouring province of Anjou this type of church is common enough. Eastward the nave opens to the transepts by one tall narrow arch, with a very low one to right and left of it. Westward we have a low broad arch giving access to a species of upper narthex, through which the great Decorated window lighting the front between the towers is seen. These are of good solid Middle Pointed character, but, like so many other French steeples, unfinished. Square-topped, slate mansards, like those at Gournay, in the Pays du Bray, and other districts of Normandy, terminate these towers. Externally the most valuable feature of Notre-Dame de Couture is its western portal, extending the whole width of the nave, as at Seez. A finely moulded arch on delicate shafts admits to it. In the tympanum is the Last Judgment, the mouldings of its encircling arch being formed of three rows of figures representing the blessed. Six colossal figures of the four Evangelists, with SS. Peter and Paul—three on either side—form the pillars supporting this arch, whose doors exhibit in small panels good Flamboyant wood carving. Altogether, Notre-Dame de la Couture, to the architect, the ecclesiologist and the ritualist is a most fascinating church, and one requiring repeated visits to be thoroughly understood and appreciated. After assisting at the chapter Mass in the choir of the cathedral, seating ourselves in such a place in the aisle that thirty compartments of glorious old stained-glass are visible at a glance, we take a boat down the Sarthe to the Bishop's Mills, where we linger until our watch and the gradually westering sun warn us that it is more than fully time to go back to Le Mans, if we are to catch the 4.50 train for Tours. So we pay our modest reckoning, express our regrets to Madame that we are not able to spend longer time in a place with which we are so *ravissés*, return to our boat, and find ourselves after a most delightful pull of about twenty minutes at the foot of the steps leading up from the river to St. Julien. Here we just have time to take one long lingering glance round the *élancé* choir from the little door in the eastern ambulatory. Returning to the hotel we get our effects snugly under hatches, and about a quarter-past four have cleared out with cargo for Tours, where after a very tedious railway journey we arrive as the gas-lights are beginning to dot its boulevards, and on whose quais a great fair is just about to make day noisy and night radiant and merry for the next fortnight.

Few cities in France could formerly boast so many and such interesting churches as the capital of the Touraine. It was in truth a city of churches and monasteries, which had gradually grown up around the sacred grotto dug by St. Gatien in the rocks of Marmoutier. Some of these had been unaccountably suffered to fall into decay at a period considerably anterior to the Revolution, but it was not until some years after that event that the destruction of the glorious abbey of St. Martin, the resort of countless pilgrims from every corner of Christendom, took place. Then it was that the church and other parts of the convent of Marmoutier which had escaped revolutionary fury were bought and razed to the ground by a private individual, who openly avowed his act as springing from a hatred of Christianity. Thus a shrine which by a hair's-breadth had escaped the lawless mob fell a victim to the hate and malice of one man, two noble steeples alone remaining as witnesses of its former magnificence. These towers, the dome of the great modern basilica reared on the site of the monastery, and the twin steeples of St. Gatien's Cathedral, while serving to break the dead, flat monotony of the city when viewed from the opposite bank of the Loire, by no means represent the ecclesiastical remains of Tours, which we are agreeably surprised to find so extensive; but none of the lesser parish churches have steeples of sufficient magnitude to impart to the city that air of grandeur presented by Rouen and Caen.

It is a common complaint with our travelled compatriots that they hear no music in the French cathedrals. Perhaps they are not in the building at the proper times. Certainly they would hear no church music in our acceptance of the term, for it is a truism nowadays to speak of the superiority of our English cathedral service—a thing *per se*. And here we must say that in no country in the world is this class of music cultivated with so much assiduity, and brought to such a state of excellence, as in England. A test of the English cathedral, collegiate and parish church service is its popularity, patent to anyone who has seen the well-filled choirs of York, Canterbury, Lincoln, Worcester, King's College, Cambridge, and St. George's Chapel, Windsor, Leeds parish church, and the dome of St. Paul's at their daily evensongs. In France all is different; no grand bursts of praise from psalm, service and anthem break the awful stillness which on ferias broods over her cathedrals. In some there is a gentle simmering of plainsong—we are speaking of the weekday offices only. Of course the manner of performing the chapter offices in the French cathedrals depends upon the pecuniary resources of each establishment. At Coutances and Sens the chapter offices are monotoned in the lady chapel, and by the canons alone. They are said *in choro* by canons alone at Bourges and Seez. At Beauvais the daily recitation of the offices by canons and chanters, unaccompanied, was very impressive, but it has of late years been discontinued. To organ accompaniment are sung the daily offices at Paris, Chartres, Mans, Bayeux, Rheims and Soissons. Few boys are present, their services being required for the ritual rather than the musical portion of the service. The finest unaccompanied daily plain chant by men's voices alone is to be heard at Amiens; being occasionally harmonised, it has a remarkably good effect, and much of the monotony is thereby avoided. The French are an early people, and the hour of performing the morning service of Terce, Mass and Sext is nine o'clock. None, Vespers and Compline will usually be found going on about half-past two. All these offices are performed to a collection of empty chairs, the "faithful" not being invited, nor are they expected to assist at them. Perhaps, Gallio-like, they care for none of these

things. To be sure there is not much inducement, and one has only to compare the locked choir and empty space before it of the Parisian cathedral with the throng invariably to be found under the dome of St. Paul's any afternoon in the week. In a word, the Anglican and Gallican systems are as different as the poles asunder, and it is idle for one moment to attempt a comparison of them.

Readers, whether musical or ritualistic—we use the latter adjective in its true sense—will be interested to learn that the daily capitular offices at Tours are performed with much solemnity. After a leisurely stroll in the quiet part of the city where the cathedral of St. Gatien stands, we enter by the south transept door, to find several little choristers in scarlet cassocks, and with the colours from the stained-glass in the clerestory just glinting upon their surplices, flitting about the solemn old choir as they find the places in the music books, while the great bell booms along the vaulted roof of the nave. Two of these small individuals form a pretty picture as, in their zuchetto-covered flaxen curls, they confabulate together, music books under arm, at the tall iron gate of the choir, with its surmounting archiepiscopal cross. Those about to take part in the morning offices begin to drop in to their appointed seats. A canon—the one, we presume, who is to sing the Mass—brings in the chalice with the paten and Host upon it, covered by the palla and the chalice veil, and on the veil the bursa containing the corporal. Placing these reverently upon the table of prothesis on the south of the sanctuary, he takes his place with the other canons *in choro* for Terce, which is then monotoned. Towards its conclusion, and while the six great candles upon the altar are being lighted, he retires to vest for the Mass. Upon his entrance in plum-coloured chasuble the choir sing the introit for St. Lawrence's Day, "*Confessio et pulchritudo in conspectu ejus; sanctitas et magnificentia in santificatione ejus.*" Then follows the psalm, *Cantate Domino canticum novum*, to a very beautiful prolongation of the Fifth Tone. A curé plays the organ, which behaves itself very well until the Offertorium, when upon the performer's essaying a very elaborate piece in honour of the occasion it becomes untractable, causing the poor curé to get apoplectic of visage and to cast sundry agonised glances across the choir at the biretta'd canons. But these dignitaries seem quite unmoved, sitting in their stalls with closed eyes and folded hands, affecting to take no notice whatever of the matter. Not so sundry of the choir-boys, whose faces give tokens of risibility. One young urchin, whose head ought to have been well punched, literally shook with suppressed laughter. The plain song to the Kyrie, Gloria, Credo, &c., is accompanied smoothly and well, but our ambitious friend breaks out again at the Elevation with another jaunty piece enough to make a stern Gregorianist shiver in his shoes, and with little better result. However, the *Domine salvum fac*, the Tonus Regius and several very beautiful "Amens" bring the Mass to a solemn and restful close.

(To be continued.)

DEVELOPMENT OF MANCHESTER.

AT the Manchester City Art Gallery on the 21st inst. a meeting was held under the auspices of the Manchester Society of Architects, at which Mr. E. Salomons, architect, delivered an address upon "The Development of Manchester and Suggested Improvements." Mr. R. I. Bennett, president of the Society, occupied the chair.

The Chairman explained that Mr. Salomons was unable to read his paper in consequence of suffering from a relaxed throat, and he had therefore asked him in his capacity as president of the Manchester Society of Architects to read it for him. Mr. Salomons commenced practice as an architect in Manchester in 1852, and was an associate of the Royal Institute of Architects in 1851. He was, he might say, the architect of the great Art Treasures Exhibition which was held at Old Trafford, and one of the founders of the Manchester Society of Architects in 1865. His views, therefore, upon the subject he had undertaken to discuss were well worthy of consideration.

Mr. Salomons at the outset of his paper pointed out that the need for a new art gallery and reference library in Manchester involved questions peculiarly inviting the attention of the Manchester architects, who would be assuredly neglecting an obvious duty if they did not give them their earnest consideration. After some interesting reminiscences of the condition of Manchester as he remembered it many years ago, Mr. Salomons said his attention was first drawn to the want of foresight and general method in our local improvements by the contrast they presented to what he saw in progress in Paris when he first visited that city in 1853. At that time Louis Napoleon, under the advice and guidance of Haussmann and the architect Viollet le Duc, was just beginning the reconstruction of Paris by forming the two great boulevards at first called Sebastopol and Haussmann, and which were cut through some of the lower districts of Paris. Soon after this the Grand Opéra was contemplated and the Avenue de l'Opéra begun, together with many other improvements. What struck him then was that the old historical boulevards and streets were never altered or touched, but left as they always had been and were in the main to-day. The same principle—the opening out of entirely new streets and squares—had been followed in all the great improvements made in the chief cities of Europe. But if we reverted to the changes that had been made and were being made in our own city, what did we find to be the rule? That the only idea, with rare exceptions, which presented itself to the authorities was to widen or extend existing streets, and now that a new art gallery and reference library were required, we found the same instinct at work, it being strongly urged that the infirmary should be removed elsewhere. What a fine site that would set free for the new gallery and library. But in the first place, a large open space did not alone constitute a fine site. To be that an open space must be surrounded by fine buildings—which was certainly not the case with the infirmary. Then, again, the sum which would have to be paid for the site was far greater than the sum for which an entirely new open space could be created in a quite as convenient part of the city. The only recommendation for the infirmary site was that it was obvious, and therefore easily apprehended by authorities whose traditional method consisted in improving what already existed, and had resulted in making our city a signal example of the waste of good buildings by placing them in positions where they were seen to the least advantage. He suggested, then, that the creation of a new square be at least considered as a possibility. The erection of a city library and art gallery presented the opportunity for a really notable improvement, one of the most important in the history of the city. And no chance of making the most of such an opportunity should be lost through failing to consider the question from every reasonable point of view. Was there, then, a reasonable opportunity of opening out a new square sufficiently near to the centre of the city? He thought there was, and his suggestion was that the Corporation should purchase the whole of the land in Oxford Street bounded by the South Junction and Altrincham Railway, Great Marlborough Street, Saville Street and Pritchard Street. That would give, including streets, an available open space of 58,000 yards or thereabouts, or about twelve acres. Of that 27,700 yards would have to be purchased—the streets accounting for the rest—and he put the extreme value of that land at from 6*l.* to 7*l.* a yard—say 7*l.*, at which figure the cost would be about 194,000*l.*, as against a minimum of say 500,000*l.* for the infirmary site. There would be ample space for an art gallery and library—say 4,000 yards each—and some thousands of yards of land would be left for sale at a considerably enhanced price. Thus a new open place would be formed, only about half a mile from the town hall, and there was no doubt it would in a few years become the fashionable centre of Manchester, as had been the case in the various cities abroad already alluded to. In suggesting this scheme he went beyond the mere need for a new art gallery and library. His primary idea was to form a new centre for Manchester, which might be developed hereafter by private enterprise in the usual way. Although he thought the situation an excellent one both for art gallery and library, others might not agree with him, especially as regarded the latter, which, it might be thought, should be in a more central position. That might be so. On the other hand, it was possible to divide the students' library from the business library, leaving the latter department in the business centre. But even if the library were not built on the newly provided site, there were many other uses to which it could, and most probably would, be put, such as a new theatre, with all its necessary appurtenances, which we did not now possess; and a new concert hall, with better entrances, staircases and ante-rooms than the Free-trade Hall provided, was also urgently needed. Why should not the Corporation build a new theatre convenient, commodious and even luxurious for the benefit of its citizens? The Corporation gave libraries, art galleries, art museums, &c., for the instruction or edification of the ratepayers; why not provide a theatre for the same object? In the former case the cost, both initial and annual, was large, but no one doubted that the money was well spent. In the case of the theatre the cost would be nil; 2,000 yards would be required; the value of the land might be safely put at 5*l.*, for wherever a large public building was placed it at once enhanced the value of the land adjacent. The building complete would cost, say, 50,000*l.* or 60,000*l.* in all. If only the same rent was

obtained as was now paid by the Theatre Royal the return would be 5 per cent. on the outlay, and as the Corporation could borrow at 3 per cent. the transaction would be a profitable one for the ratepayers. He further suggested that if such an open space be made Oxford Street should be widened to, say, 120 feet right up to Whitworth Park, and that would at once decide what would be for the future the fashionable and literary, educational and art centre of Manchester. We should have then in its nearly two miles of length the Midland Hotel, the theatres, concert-rooms, Art Gallery and Reference Library, School of Art, Owens College and Whitworth Park and art galleries. We must, Mr. Salomons urged, dismiss from our minds the antiquated idea of Manchester as a little provincial town, with its High Street and Market Street, and everything of importance necessarily close to these. Like all metropolitan towns—headquarters for many surrounding towns—it must have its different centres, and these inevitably some distance apart. The half-mile from its centre must be reserved mainly for business premises, the demand for which had increased so rapidly of late, and must inevitably continue to do so, in view of the increasing thousands of business men from neighbouring towns, for whose convenience business must be concentrated as near as possible to one centre. A business centre and a neighbouring literary, art and educational centre was the ideal we ought to have in mind, and which we had now the opportunity of realising. Was it too much to hope that, with the chairman of the improvement committee as Lord Mayor, the present year would see a beginning made to reach such an eminently desirable consummation?

In the course of a brief discussion,

Mr. Charles Rowley said that, without entering into the merits of the Infirmary site, he somewhat agreed with the view expressed by the reader of the paper. The Infirmary site had been before the people of Manchester since he could remember as a sort of burning question. He felt personally interested in the beauty of the city, and he thought it would be much better to adopt some such scheme as that laid before the meeting than to enlarge on the Infirmary site, which seemed to him impracticable. Inasmuch as some years ago the value of the land occupied by the Infirmary was stated to be 750,000*l.*, it might safely be put at a million of money to-day. Considering that Oxford Road was the main street leading out of Manchester, he thought anything more hideous than that thoroughfare beyond the railway arch could not be found in any great city. The shabbiness of the whole situation was disgraceful. Some such scheme as that proposed would certainly give a fillip to the improvement of the whole of that side of the city. Mr. Salomons threw out a fascinating idea when he suggested that the various intellectual developments of the city should be focussed, as it were, in one line. We had some extremely beautiful buildings in Manchester, but they were utterly ruined by the dirt and filth of the atmosphere. If anything could be done in the future to cleanse the town a scheme like that proposed might have a practical chance of being considered, if not carried out. If some more statesmanlike view were taken of the improvement of the city it would be better than our present rather peddling manner of carrying out that kind of work.

Mr. Plummer, a member of the City Council, said he held as lofty an ideal of what Manchester might become as any man present, and could he have had his own way in the matter he should have laid down, upon Mr. Salomon's ideal, a Manchester which might possibly have taken a hundred years to realise. It did not follow that they need despair if they could not carry out such a scheme as that suggested by Mr. Salomons in one day. When the question of the removal of the free reference library was mooted the committee first fixed upon the site in Oxford Street now occupied by the warehouse of the Tootal Broadhurst Lee Company. It would have been an admirable site, and they did their utmost to press it forward; but they met with the very faintest appreciation and support, and were told by men who were also interested in the city that it was too far out. If that were so, what chance was there of Mr. Salomons's scheme being carried into effect? There was also offered to the authorities on very advantageous terms a large portion of the Whitworth estate for the new technical school. That, however, was utterly scouted, and therefore, while he looked at the plan prepared by Mr. Salomons with something like envy and admiration, he was very sorry to say that he felt it was not at present realisable. He had also to say that he thought Mr. Salomons had taken a very modest view of the cost of the work. At the present time Manchester was very heavily burdened in the matter of rates, and in the state of the public finances and the present apathetic condition of the public mind he felt that the scheme would hardly receive the recognition which it merited.

Mr. Salomons, in reply, said he anticipated a great deal of the difficulty that would arise in carrying out the scheme he had brought forward, but he thought perhaps by laying it before the public the Corporation might be induced to adopt a little different mode of carrying out improvements in Manchester. He had carefully gone through the question of expense, and he had no hesitation in saying that in the course of a few years it would be actually a profitable and not a losing scheme. He was not prepared to say that his was the best scheme, but he did say that there should be some large scheme to work upon, instead of the present method of making improvements in little details.

Mr. Salomons was thanked for his paper.

EARLY CHRISTIANITY IN SHETLAND.

CHRISTIANITY, says the *Scotsman*, was introduced into Orkney and Shetland by King Olav Tryggveson towards the close of the tenth century, and at the point of the sword. He arrived at South Ronaldsay and invited Earl Sigurd and Hind, his son, on board his ship. On their arrival he said to the earl, "You are now completely in my power. You must, together with all the people in your dominion, either accept Christianity, be baptized and yield me homage, or immediate death and eternal punishment await you." The earl calmly replied that he could not be induced either by choice or fear to forsake the religion of his fathers and deny the established worship of the gods, nor did he know in what respect the adoration the king demanded exceeded his own. The king then drew his sword and seizing Hind said, "Now I shall keep my word. Unless you and all your people profess yourselves the servants of the God I revere, your son shall perish before your eyes, and one common destruction shall follow." Earl Sigurd and his son and the people then submitted to baptism. The king shortly afterwards, with Hind as a hostage, sailed for Norway to proclaim the success of his mission, and sent Segismund Bretteson, a Faroese, to baptize, according to the royal method, the heathen of Shetland. In subsequent reigns inquiries were made into the spiritual condition of the islanders, but until the twelfth century was far advanced the reports were very discouraging.

The spirit of Christianity was so utterly opposed to the spirit of the ancient religion with which the minds of the Scandinavian settlers in Shetland and their descendants were so deeply imbued, that conversion in its truest and highest sense must in any case have been slow, and the introduction of Christianity in such an un-Christian manner made it slower still. The period was the most heroic in the history of the northern world—the age in which the mutual jealousies and hostilities of the Scandinavian nations began to be most accentuated, and war, conquest and plunder occupied the minds of men. It was the god of battles and not the prince of peace that men felt inclined to worship, and there was so little of peace and conciliation in the system as introduced by the king that the people saw no difference between the old religion and the new. The conduct and method of King Olav and the early pioneers of Christianity in the northern groups must have been keenly felt and resented, and may account for the fact that in the customs and lives of the people the tenets of an earlier religion continued to exercise a more powerful influence, and to exert a more willing obedience, than those of the Church.

At the same time, the claims of the Church were incompatible with the odal rights of the people. What the Udallers adhered to most tenaciously was their odal or natural rights. They maintained that the king was the lord of the people, but not of the soil, and the utmost that ever he had been able to squeeze out of them was a tax on their hill pastures. Their odal or enclosed lands they held from God and had managed to keep them inviolate. It was the invasion of their odal lands by the Church that intensified the hostility of the Udallers to the establishment of Christianity. The question of free land played much the same part as that of free religion in the seventeenth century. The priests met the claim of Divine right in land made by the Udallers by a counter claim. They asserted that the Church was a fief of St. Olav, that his power as king on earth and saint in heaven resided in the see of Throndheim, under whose authority they acted, and that their claims were a last will and testament. The Udallers also regarded their rights invaded in another sense. The temple was to them an important institution. When they took possession of the islands, their first public act was to build a temple, and they called themselves by its name. The temple thus became the nucleus of the new community. As soon as a sufficient number of independent temples were erected, the Althing was formed, and the foundation of the general government was laid. Priest and chief were synonymous terms, and continued so until a ban was placed on laymen interfering in Church affairs. That ban deprived the chiefs not only of their authority and influence, but of their birthright. Between the chiefs and the Church a state of war existed, and each was resolved to conquer. Had suavity and tact been employed at first, much might have been done, but even in the management of his personal affairs King Olav knew little of either. He wished to marry Sigrid the Haughty, the Queen-Mother of Sweden, in the belief that he would thus unite Norway and

Sweden against Denmark. His one condition was that she should embrace Christianity. On her refusal he struck her on the face, saying, "Why should I marry thee—a heathen jade?" His missionaries acted on the same principle, and offered to fight everyone who hesitated to submit to baptism. It is a fact, and a strange one, that from the first, with one or two exceptions, the outside influences brought to bear on Shetland have, through the agencies employed, tended more to repress and compel, often to fleece, than to foster, encourage and elevate.

The resistance of the Udallers to the claims of the Church continued, but as time rolled on the mythology of the north lost its hold on the public mind, and the wives and daughters of the Udallers came to prefer the love and gentleness and forbearance the Gospel enjoined, to the storms and conflicts and bloodshed their ancient system encouraged, and they did far more for the propagation of Christianity than the agents of either the king or the Church. It was for a generation or two the one great question, and as soon as the fury of the Udallers began to show symptoms of abating, the prospect of granting as many souls seats in heaven as the churches they built contained seats for the people was held out to them. Valhalla offered no higher prospects of authority and future union, and kirk building became the order of the day. Every district had its church, and every rich Udaller had a kirk on his homestead for his family and dependents and a family priest to conduct the service. In the thirteenth century there were upwards of one hundred kirks in the islands.

The monastery and headquarters of the Church was at Sound of Weisdale. There seems to have been a monastery or something like it at Cross Kirk, Northmairne, and at Unst; but that of Weisdale was the chief. The situation of the Sound of Weisdale was favourable. It was on the highway between the east and west, was on the centre of the mainland, and missionaries from there could with more ease visit any district where their services, either in religious or secular matters, were required. The monastic buildings must have been of an imposing character in their day. They furnished building materials early in the last century for a large mansion-house, garden walls, piers and other erections for a wealthy landowner and merchant, and the ruins of the kirk were used in building a churchyard wall about forty-five years ago. The kirk was an awmus winner as late as 1840.

Tingwall in pre-Christian times was the headquarters of heathendom in Shetland, and that may have been one of the causes for the selection of Weisdale as the seat of the Church. It was attacking the lion in his den. Tingwall was the seat of the ancient lawting, and there were at least three heathen temples within its bounds. One stood near where the parish church now stands, and was the sanctuary which men condemned to death by the lawting tried to reach; another was on the west side of Whiteness Voe, opposite Wormadale; and the third was in the valley of Weisdale. Weisdale was early selected by the priests of Odin for a settlement, and from that circumstance the district derives its name—the dale or valley of religion or worship.

The Church offered prospects of ease and respectability to young men, and in consequence priests were numerous. To their other duties, as soon as they were licensed, that of schoolmaster was added. The priest who kept the best school was appointed to the first vacant church. They taught reading, writing, Latin and the canon law. The scholars were young men preparing for the Church and the sons of rich Udallers, but the sons of poor parents were admitted if they gave evidence of abilities and were anxious to learn. Many of the priests were excellent penmen, but Latin occupied the first place in the schools. On great occasions, when the bishop addressed the people he spoke first in Latin and then translated his speech into Norse. The Latin phrases still used by old people in remote districts must have been handed down as heirlooms from that distant period.

Reverend was not a designation applied to the priests at that period. Sir was prefixed to their names when they were licensed, and when a bishop was consecrated he became a lord. Bishops were held in high repute, especially when canonised. They answered prayers, performed many miraculous cures and did fully more good dead than alive. Prayers to the saints were constantly made by both priests and people in all cases of sickness and difficulties. The saints on whose prompt assistance the greatest reliance was placed were deceased bishops who had been locally canonised. Priests from Norway sometimes refused to recognise saints who had not been acknowledged by the archbishop and bishops in Throndheim, but in such cases the refractory priest was soon taken ill, and continued so until he repented and prayed to the saint he had despised. When King Eric was on his way to a council of kings he was becalmed for several days. Prayers were made to many saints without effect. At last an island priest advised the king to pray to the late bishop of his diocese—a saint who was always "swift to hearken to prayers." The king did so, and immediately a fresh breeze carried him to the harbour he wished to reach. The names of several persons are still preserved who were miraculously cured by prayers to the saints. When ordained, the priests were examined as to their knowledge and fitness, and an inquiry was made into their past lives. If they were the acknowledged fathers of illegitimate children no objection was made, but if they had unacknowledged children, severe penalties were inflicted. It sometimes happened that a father and his illegitimate son worked as priests in the same district. The severest examining tests applied to the priests were those of reading and chanting. Failure in those subjects was fatal. The archbishop and chapter advised that when vacancies occurred in Shetland they should, if possible be filled by Shetland men, as they understood the people better than strangers. That sage advice still holds good.

The clergy were ever on the move towards Norway. Scarcely a ship sailed from Shetland in summer and harvest that did not have a clergyman on board, and their stay in Norway was often prolonged. Sometimes they went on their own account, at other times on the affairs of the Church, but more often they were the agents employed by the authorities in their appeals to the archbishop. The disputes among themselves had all the animus of the same class of disputes as in the present day. They tried to undermine and outwit each other, and their agents were sometimes sent as privately as possible by different ships on the same day. The archbishop always treated the provincial priests kindly, invited them to his table, engaged tutors to teach them the canon law, and decided in favour of those who had most tact and kept closest to him.

The revenues of the Church were drawn from various sources, such as tithes, fines, gifts, alms, burials, trade and loans. The principal church in every parish lent money on interest, and anyone could borrow if they left gold or refined silver in pawn. If repayment was not made the Church kept the deposit, and those unredeemed pledges formed a large source of income. The tithes, the banking system, the fines, gifts and alms were adopted by the reformed Church, and continued until the present century was well under way. After the Poor-law Act was passed the alms went to the missionary societies, and many are the crowns and half-guineas these societies have received from successful whale-fishers. Marriages were a fertile source of income to the Church. It is difficult to get at the exact ancient forms, but the consent of parents, the feast, the ring and the cup of mead of which the bride and bridegroom drank were essentials. A man could not marry a near relative, but he could marry his brother's widow. When the fathers were priests in their own right stranger priests were not necessary, and all they had to do at any time was to see that the ancient rites were observed. The Church placed all such marriages under a ban, and all marriages were declared illegal that were not performed according to the rules and ceremonies of the Church. Heavy fines were levied in each case, but the resistance offered was so strenuous that marriages according to the ancient rites continued to be celebrated for centuries. Many of the old ceremonies still linger. Fines for offences were often heavy. In one case a man was sentenced to pay a sum equal to his own weight in silver, and he paid it.

Fixing the tithes was a most important matter, and the cause of numerous disputes between the wealthy Udallers and the Church. The usual plan was to appoint an equal number of priests and laymen to value a certain property, and if the owner considered the valuation too high the Church threatened to excommunicate him, and compelled him to submit. Excommunication was a most powerful weapon. One valuation did not suffice, but valuations were made as often as improvements were made on a property. A value of 7,200 ells of wadmal more than he was paying tithes for was once put on a man's property—a value equal to the market price at that time of 150 merks of land. In another case the Church had come into possession of two-thirds of a certain property and wished to have the whole. The owner of the remaining third refused to sell. He was excommunicated and compelled to dispose of it to the Church as a perpetual possession. The Church came into possession of a large amount of property in land in Shetland. Some of it was likely lost about the period of the Reformation, but in 1814, when the teinds were valued and paid in money, it was found that more than one-fourth of the land in the islands belonged to the Church. The teinds varied in the different parishes. In some they were valued at 500*l.* per annum, and in others at 89*l.*

The Metropolitan Tabernacle rebuilding committee announce that the lower hall is ready for occupation, and will be opened for public worship on New Year's Day. The hall, they say, is an extremely fine building, is sufficiently high, comfortably warmed and lighted by electricity. There are temporary vestries, a bold platform and a baptistery. The total seating capacity is nearly 2,000. The contract of Messrs. Higgs & Hill, Limited, for the erection of the main building at a cost of 32,550*l.* has been accepted, but other items will raise the total expenditure to 44,576*l.* 14*s.* After allowing for the amount received for insurance and by subscriptions, there will still be required about 16,000*l.*

ARCHITECTURAL ACOUSTICS.*

THE acoustic problem by which the architect of an auditorium is confronted is threefold—that of securing the greatest loudness throughout the hall of a sound produced at some chosen place, proportional loudness of all component notes, and the greatest distinctness of successive enunciations. These three are the necessary, as they are the entirely sufficient, conditions for good hearing. Each, however, can be secured only at the partial expense of the others. The solution of the problem is therefore essentially a compromise. Moreover, it is a compromise that must be met differently according as the hall is to be used for speaking or for music, and if for music differently for different kinds. It is in the solution of this problem that I hope to be of service.

The simplest auditorium is, of course, the open air. In this case, however, the sound diminishes rapidly in intensity, as it spreads uninterruptedly to a greater and greater distance. A wall immediately behind the speaker would reflect to the audience the portion of sound otherwise lost in that direction. A ceiling overhead, side walls and a wall behind the audience would save even more. Should these surfaces be perfect reflectors, no matter how they might be placed, all the sound reflected from wall to wall would ultimately reach the audience. In fact, however, walls though good are not perfect reflectors, and there is more or less loss. Moreover, the sound that has suffered many reflections and has travelled far will arrive too long after the sound coming directly to be of service in reinforcing it. It is desirable, therefore, to so shape the room, so turn the walls, and so incline the ceiling, as to reflect the sound direct on the audience. Surfaces not so available should be deadened into being poor reflectors. These considerations lead immediately to the following recommendations, which, however, are not always practically available. A wall immediately behind the speaker, angle walls cutting off the corners of the room at each side of the speaker, and a sloping ceiling, not high, immediately above him are advantages. A curved ceiling over the audience, or one with sloping sides, is favourable. On the other hand there is no especial advantage in an ellipsoidal shape, as is often stated. An accurately ellipsoidal shape, with the speaker at one focus—an often recommended arrangement—would profit but one particular point in the room, the other focus, and would make of the whole a whispering gallery. Again, a room shaped like a paraboloid, and this also has been proposed, would be positively bad, unless the axis of the paraboloid were very much inclined to the horizontal—never part of the plan. Indeed, the conic surfaces have been merely words to conjure by. There is no simple, geometrical surface ideal for this purpose; for the variables—reflection, diffraction and absorption—make the problem very complex. Each case must be worked out on its merits. To return, a curved ceiling over the audience, reaching low behind the speaker and at the rear and sides of the hall, is good; but a curved ceiling, having the speaker at the centre of curvature, is the very worst possible. The rear wall and the more distant side walls are, on account of distance, likely to be valueless or worse than valueless, except to the audience near them. They may, therefore, to advantage be low, or occupied by galleries, which when furnished with cushions or filled with people are poor reflectors.

In considering any special case it is to be borne in mind that the sound coming directly from the speaker is diminished in intensity not merely on account of the distance, but also from absorption by the garments of the audience over which it passes. Therefore, if the ceiling be very low, hearing, while good in front, will be bad in the rear of the hall. This is especially true beneath a low gallery. Here there is a double disadvantage; the sound enters the opening in front diminished in intensity by travelling over the audience, and screened by the gallery, this part of the house gets no benefit from the reflection by the ceiling. The impression of persons occupying such positions is that the sound seems smothered. On the other hand, the sound that enters the gallery, having travelled further above the audience, has lost less by absorption and is more reinforced by reflection from the ceiling. The hearing in the front rows of the gallery is therefore excellent, and the gallery may well have a greater depth than the balcony below it. In both the seats should rise more rapidly than on the floor in front not merely for seeing but for hearing purposes, and also to avoid leaving bare walls to reflect prejudicial sound to other parts of the hall. In even the gallery the depth cannot much exceed the clear height above it without giving cause for complaint.

Throughout all speculation in regard to reflecting surfaces there is one point that must not be lost sight of. Reflection from any extended surface is regular only when the minor inequalities, as ceiling decorations, panelling, ornamental niches, recesses of doors and windows, are small in comparison with the wave length of the sound; otherwise the reflection is diffused.

The next phase of the architect's problem is much more intricate, and only an outline may be here attempted; in scientific acoustics it is called "interference." Up to this point the direct and the reflected sound have been spoken of as if always reinforcing each other when they come together. A moment's consideration of the nature of sound will show that as a matter of fact it is entirely possible for them to oppose each other. Thus the sounding body in its forward motion sends off a wave of condensation, which is immediately followed through the air by a wave of rarefaction produced by the vibrating body as it moves back. These two waves of opposite character taken together constitute a single sound wave. The source continuing to vibrate, these sound waves follow each other in a train. Bearing in mind this alternating nature of sound, it is evident that should the sound, travelling by different paths—by reflection from different walls—come together again, the paths being equal in length, condensation will arrive at the same time as condensation and will reinforce it, and rarefaction will similarly reinforce rarefaction. But should the one path be a little shorter than the other, rarefaction by one and condensation by the other may arrive at the same time, and at this point there will be comparative silence. The whole room may be mapped out into regions in which the sound is loud and regions in which it is feeble. When there are many reflecting surfaces the interference is much more complex. When the sound changes in pitch the interference system is entirely altered in character. These are not merely theoretical considerations. A room in the Harvard Physical Laboratory has been partly mapped. This room, known as the constant-temperature room, is of the simplest possible character. The four walls, the ceiling and the floor are plain, there being no windows and the door being flush with the wall. This room has been of great service during the past three years as a place in which to try preliminary experiments on a small scale before passing to the more complicated conditions of a large hall. One occurrence in this room will illustrate the point under consideration. The source of sound was a middle C organ pipe, blown by a steady wind pressure. The observer, on changing the position of his head by 10 or 12 inches, could hear the note change in the most positive manner from middle C to the C an octave above. The explanation is simply this. The organ pipe did not give a single pure note, but gave a fundamental middle C, accompanied by several overtones, of which, in this case, the strongest was the octave C. Each of these notes has its own interference system, and near the observer the region of silence for one system happened to coincide with the region of reinforcement in the other, and *vice versâ*. Thus the observer in one position heard the fundamental note and in the other the overtone. The confusion that this phenomenon is capable of producing in the complex and rapidly changing sounds of the human voice is evident. Such is the pathology of "interference," but I am unable to propose a cure for it that would be generally applicable, although in the case of one hall it was possible to relieve somewhat this particular difficulty. Until recently it seemed possible to formulate a general line of procedure, but this now seems doubtful.

The third phase of the problem, while in many ways not so intricate as the last, deserves careful consideration, because in it lie the most frequent and needless failures. Sound, being energy, once produced in a confined space, will continue until either transmitted by the bounding walls or transformed into some other kind of energy, generally heat. This process of decay is called absorption. Thus in the lecture room of Harvard University, in behalf of which this investigation was undertaken, the absorption was so slight and the residual sound was audible so long after the source of sound had ceased, that it was quite impossible by speaking loudly or gently to make one's self understood at the other side of the room. Even a very deliberate speaker would utter twelve or fifteen syllables during the audibility of one. With a large audience present it was not so bad, but was still intolerable. Such a misfortune as this may arise from two causes. If it occurs in a room when the audience is small the prominence of the defect may be due to the absence of sufficient absorbing power in the material and the furnishing of the room; if the defect continues when a large audience is present it arises also from a failure to have so shaped the room as to adequately employ the great absorbing power of an assemblage of people. In this particular case, the appearance of the room being very attractive and the lighting excellent, alteration of shape was out of the question, and it was desirable that any permanent device should be inconspicuous. It was requested that some accurate numerical measure of the acoustical quality of the room should be secured, and that the investigation should be conducted in as quantitative a manner as possible. The resulting experiments have extended, more or less interruptedly, through the past three years. The first method for determining the rate of decay of the sound, and therefore the amount of absorption,

* A paper read at the convention of the American Institute of Architects by Mr. W. C. Sabine, assistant professor of physics in Harvard University.

was by means of a sensitive manometric gas flame measured by a micrometer telescope. Later, photographing the flame was tried; but both methods were abandoned, for they both showed, what the unaided ear could perceive, that the sound, as observed at any point in the room, died away in a fluctuating manner, passing through maxima and minima. Moreover, they showed what the unaided ear had not, but immediately afterward did recognise, that the sound was often more intense immediately after the source ceased than before. All this was interesting, but it rendered impossible any accurate interpretation of the results obtained by these or similar methods. It was then found that the ear itself, aided by a suitable electrical chronograph for recording the duration of audibility of the residual sound, gave a surprisingly sensitive and accurate method of measurement. For example, in the constant temperature room of the physical laboratory it was possible to detect by this method the alteration of the rate of absorption of sound produced by a piece of hair felting a foot square placed anywhere on the floor; it was easy to detect the difference between the effects produced by a man or a woman coming into the room, and to detect, though with considerable difficulty, even a slight difference made by a change in the clothes of the observer. Thus, failure to record the clothing worn in a certain series of experiments made it necessary to discard over 3,000 observations. In a large auditorium, of course, such small differences could not be noticed, but the method was one of remarkable delicacy. It was also very constant in its results, provided the experiments were undisturbed by outside noises. Proper conditions could be secured only at night between twelve and four o'clock, and all the experiments were performed at that time. Considerable additional accuracy is gained by taking the average of a large number of observations in each case, instead of relying upon a single one. This method in the hands of different observers gives almost identical results, provided they practise sufficiently and are not of abnormal hearing. Three gentlemen have devoted the necessary time to test this point. Experiments have been carried on in the following rooms belonging to the University—the large lecture-room above referred to, two rooms in the physical laboratory, of which one is the constant temperature room, Sanders Theatre, Appleton chapel and four rooms in University Hall, including the faculty room; also Steinert Hall in Boston, devoted to chamber concerts, and the First Parish Church in Brighton.

The relative absorbing power of various substances was tested in the following manner:—Having determined the duration of the residual sound in some room when entirely empty, a small amount of some standard substance was brought into the room, and the duration of the residual sound was again determined. This was repeated as more and more of the substance was brought in. The results were then plotted on co-ordinate paper, giving what might perhaps be called a calibration curve of the room. For example, in the lecture-room, whose plan of elevation is shown in fig. 1, the duration of the sound was 5·62 seconds. Hair cushions of high grade were obtained from Sanders Theatre. On introducing 27 running feet of these cushions the duration of the residual sound fell to 5·33 seconds; 56 feet brought it down to 4·94

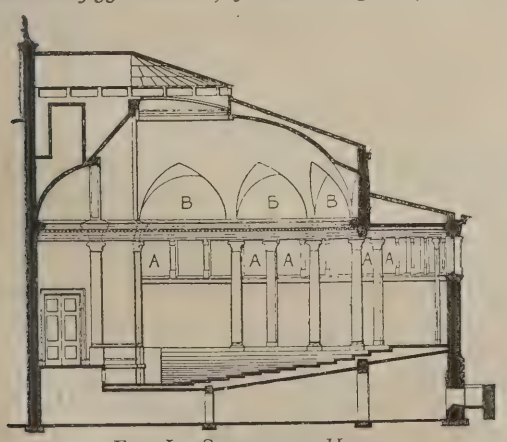


Fig. 1.—Section of Hall.

seconds. This process was continued until 1,500 feet had been gradually introduced into the room, and the cushions covered all the chairs, the aisles, the platform and, hanging from the ceiling, they covered the wall at the back of the room. The duration of the residual sound fell to 1·14 seconds. These results when plotted gave the curve shown in fig. 2. This experiment, requiring of course several nights' work, having been completed, all the cushions were removed, and the room was in readiness for the test of other absorbents. Curtains of chenille, 45 inches wide and 56 feet in total length, were draped in two of the spaces between the columns. This reduced the duration of the sound to 4·51 seconds. Referring to the curve it is obvious that this amount of chenille, when so draped, is equivalent to 100 feet of cushions. The curtains were then removed, draped in front of the rear wall and again tested. They were then draped beside the platform. From these experiments, in which the curtains occupied first one part and then another of the hall, the result was deduced that on an average 23 square yards of chenille draped as a curtain were equivalent to 15 square yards of cushion. Oriental rugs of the highest grade, thick, heavy Herez Demirjik and Hindustanee, were tested in a similar manner. Cretonne cloth, canvas and hair felting were tried with the comparative results indicated in the table:—

Relative Absorbing Power.

Hair cushion on seats	per square yard	2·03
Heavy Oriental rugs on floor	,, ,,	·56
Chenille draped as a curtain	,, ,,	1·32
Cretonne cloth hanging flat	,, ,,	·33
Canvas ,, ,,	,, ,,	·71
Hair felting on the wall:—		
,, ½ inch thick	,, ,,	1·0
,, 1 ,,	,, ,,	1·8
,, 2 inches thick	,, ,,	2·4
Audience, per person		1·3
Individual man, sitting clear		1·8
,, woman ,,		2·2

Some observations were also made on the effect of cushion coverings; experiments in the laboratory with rubber gossamer showed that the covering, no matter how impervious to air provided it be soft and flexible, had no effect on the absorbing power of the cushions. This result was confirmed in Appleton chapel. After testing this room with the leather-covered cushions in their ordinary positions they all were turned over, thus exposing a canvas covered side. The difference in the duration of sound was scarcely perceptible. Perhaps the most interesting of these results is the one measuring the absorbing power of an audience. It was obtained through the kindness of 121 persons, who in the summer of 1897 submitted to the experiment. Of this number sixty-five were women and fifty-five were men. The experiment was not performed so late at night as might be desirable, but this was partly compensated for by having two observers. Their results agreed almost exactly. The result given in the table is the average absorbing

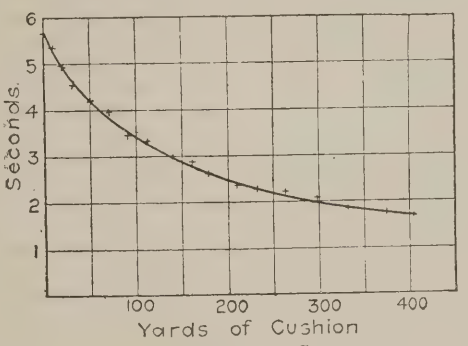

Fig. 2.—Effect of Cushions.

power per person, without distinction between men and women. Other experiments on individuals were made in the laboratory in the fall, when heavier clothing was worn, and gave on the average as the absorbing power for man 1·8 and for woman 2·2. Here, unlike the preceding case, the individuals were not screened by neighbours and near chairs. Another result is interesting as a partial answer to a question that is frequently asked in regard to the effect of beams and girders. An openwork scaffolding, consisting of about 400 feet of plank and 600 feet of scantling, gave almost no appreciable absorbing effect. It may have had another effect, but that is a subject too intricate and tedious to be discussed here.

It must not be thought that an absorbent is always desirable, or if desirable that it is so at any point.

This completes the independent discussion of the three factors in the architect's problem, loudness, interference and distinctness, and brings us again to the initial proposition that the solution of this problem as a whole is necessarily more or less a compromise. Loudness—all the loudness, it is safe to say, that an architect can secure, provided it be as uniform as possible over the hall—is desirable. Interference, with its consequent distortion of chords and complex sounds, is, with equal positiveness, undesirable. Loudness can be obtained only by the superposition of direct and reflected sound, and superposition of sound cannot be had without the danger of interference. In this dilemma the architect would do well to devote himself to the consideration of loudness alone. Interference is practically a less noticeable evil than either deficient loudness or excessive residual sound. Residual sound, always an evil in a hall used for speaking, can be

reduced to a minimum by so inclining surfaces as to bring all the sound by one reflection upon the audience—always the most active absorbent factor in a room. This will also make the loudness a maximum. In order that the hall may remain good when the audience only partly fills the hall, the chairs should be provided with cushions—the next most active absorbent material on our list. While the residual sound should be a minimum in a room devoted to speaking, to military music, perhaps also to orchestral music, it probably should not be a minimum in a room designed for chamber concerts, and especially if designed for piano music. In the latter case the effect of the residual sound is to increase the fulness of tone of the instrument, and to diminish its staccato effect. A suggestive incident occurred in the recent investigation conducted by the Department of Music of Harvard University to determine whether a certain room was suitable for a series of chamber concerts to be given in connection with one of its courses. The test, by a very select audience of experts, was made with piano music, and was conducted under such conditions, size of audience and so forth, that the duration of the residual sound was 2·5 seconds. The room was pronounced satisfactory. On the whole, however, this use of the auditorium as a contributor to the æsthetical value of the musical production rather than as a vehicle of exact transmission, is a too serious complication of the problem.

The preceding suggestions have been on the supposition that the architect could control his design by acoustical considerations alone. This is of course not the case. The artistic appearance of the hall, adherence to conventional forms, as a lofty ceiling in a church, adequate and pleasing lighting by day and by night, adequate and uniform ventilation, all make demands at times incompatible with acoustically ideal conditions. A hall having proved faulty under trial, it may become necessary to diagnose the case and prescribe the remedy. There is no simple treatment that can cure all cases. There may be inadequate absorption and prolonged residual sound; in this case absorbing material should be added in the proper places. On the other hand, there may be excessive absorption by the nearer parts of the hall and by the nearer audience, and the sound may not penetrate to the greater distances. Obviously the treatment should not be the same. There is such a room belonging to the university, known locally as Sever 35. It is low and long. Across its ceiling are now stretched hundreds of wires and many yards of cloth. The former has the merit of being harmless, the latter is like bleeding a patient suffering from a chill. In general, should the sound seem smothered or too faint it is because the sound is either imperfectly distributed to the audience or is lost in waste places. The first may occur in a very low and long room, the second in one with a very high ceiling. The first can be remedied only slightly at best, the latter can be improved by the use of reflectors behind and above the speaker. On the other hand, should the sound be loud but confused, due to a perceptible prolongation, the difficulty arises from there being reflecting surfaces either too far distant or improperly inclined. The most immediate remedy in this case is covering these surfaces with some absorbent material—curtains or hair-felting. The lecture-room referred to above may be taken in illustration. Hair-felting ¾ inch thick was placed in the fourteen vertical rectangular places marked A, beside the windows, covered with thin tinted asbestos paper, and protected by wire guards. Hair-felting 1½ inch in thickness, similarly protected, was placed in the seven vertical, semicircular onsets in the dome marked B. The platform was covered with carpet doubly lined.

The above is a partial account of perhaps the first quantitative experimental investigation of this subject. There is a little more that might be given, and there is a great deal more that might be investigated, but a further research would be laborious and very expensive.

Correspondence

Workmen's Compensation Act.

Sir,—It is to be regretted that County Court judges are disagreed as to the practice which should prevail under this important Act, and that in some districts injured workmen are encouraged to go directly to the county court for compensation before they have attempted to come to terms with their employers, either personally or through the intervention of an arbitrator other than the County Court judge. When the Bill was under discussion in Parliament efforts were successfully made to provide means for disabled workmen to obtain compensation in a prompt and easy manner without unnecessary delay or friction, and without the necessity of having to go to a court of law or to seek legal assistance. For claimants, therefore, to proceed at once to the County Courts for the relief provided by the Act seems distinctly contrary to the intention of the Legislature. The Home Secretary and the Colonial Secretary told the House of Commons that it was the desire and hope of the Government that committees would be established between employers and workmen to settle all questions under the Act, but if there was no committee, and the parties did not agree, the matter should be settled by a suitable arbitrator appointed by the parties, or, in the absence of agreement, by the County Court judge. The Attorney-General said, "The arbitration contemplated is intended to be something in the nature of a domestic forum, which shall settle matters in a cheap and expeditious manner." Yet we see workmen resorting immediately to the county court before endeavouring first to come to terms with their employers, either by mutual agreement or by means of the arbitration specially provided for by the Act. In this respect the Scotch sheriffs seem to have a more accurate conception of their new duties than some of the English County Court judges. In a case recently decided at Glasgow a question arose as to the proceedings antecedent to the bringing of a claim into Court. The learned sheriff gave a remarkable decision, which, if upheld by the superior Courts, will show that our County Court judges are wrong in entertaining a claim under the Act before they are satisfied that there has been a genuine attempt made to settle the claim by mutual agreement or arbitration. The Court held that a formal application should be sent by, or on behalf of the workman to the employer, stating the claim which is advanced, and, of course, if the employer agrees to pay the amount demanded there is an end to all proceedings. If, however, the demand is resisted it rests upon the parties claiming relief to make overtures as to the appointment of an arbitrator, and it is only if an arbitrator cannot be mutually agreed upon that the sheriff or County Court judge can be asked to act as arbitrator. On reference to the second subsection of the second schedule it clearly appears that, as an antecedent preliminary to coming into Court a bona-fide effort must be made to see whether the parties cannot mutually agree upon an arbitrator. The first subsection contemplates an arbitration committee representative of employers and workmen, and to them it is proposed that the post of arbitrators shall be given where such committee is in existence. The next subsection then goes on:—"If either party so objects, or there is no such committee, or the committee refers the matter, or fails to settle the matter within three months from the date of the claim, the matter shall be settled by a single arbitrator agreed on by the parties, or, in the absence of an agreement, by the County Court judge." "Therefore," said the sheriff, "it seems that petitions brought in this Court should set forth that there has been a failure to agree upon an arbitrator, which necessarily infers that some bona-fide attempt has been made to that end." This decision is likely to tend towards the establishment of a better understanding between employers and men as regards immediate relief to disabled workmen, and if our county courts take the same view of the arbitration clauses of the Act as the Scotch courts do, it is probable that there will be less friction and litigation between the employers and workmen than the enemies of the Act anticipated.—I am, &c.,

M. Roberts-Jones, County Coroner.

Cardiff.

General.

An Exhibition of Drawings by the late Sir Edward Burne-Jones will be opened at the Burlington Fine Arts Club on January 2 next.

Mons. G. Dumont has been elected president of the French Society of Civil Engineers for the coming year.

Mons. Roty has received a commission from the Paris Municipal Council for a medal to commemorate the construction of the new prison at Fresnes. His fee will be 12,000 francs for the die.

Mons. Normand, the architect, has been elected vice-president of the Académie des Beaux-Arts for 1899.

A Monument to Bishop Butler, the author of "The Analogy of Religion," in Durham Cathedral will be unveiled in a few days. This monument is a gift from Lord Northbourne, and the inscription is from the pen of Mr. Gladstone. Butler is buried in Bristol Cathedral, where there is a monument to him, with an inscription by Southey.

Mons. Guillaume, the French sculptor, is not likely to be formally received at the Académie Française before the end of February or the beginning of March. The discourse he has prepared for the occasion would fill a volume, and will have to be reduced.

The Paris Municipal Council has voted 500 francs towards the cost of erecting the memorial of the late Charles Garnier, the architect.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

IN the ventilation of the large new warehouses erected in Ingram Street, Glasgow, for Messrs. J. & W. Campbell & Co., and designed by Messrs. Baird & Thompson, architects, Cousland's improved "Climax" patent direct-acting turret ventilators have been used, being supplied by the "Climax" Ventilating and Heating Company, Glasgow.

THE Architects', Surveyors' and Auctioneers' Diary, published by Messrs. Waterlow, Brothers & Layton, has much to recommend it to professional men. But from the complete lists of members of the various architectural, engineering and other societies which it furnishes the diary becomes a directory which will be of service to the various building trades. Accordingly, it is deserving of more general patronage than might be supposed by those who are not aware of its carefully-prepared contents.

VARIETIES.

EXTENSIVE plans for the destruction of old and the opening up of new streets in Berlin have been prepared. The chief improvements are contemplated in the neighbourhood of the royal castle and the Kaiser Wilhelm memorial. A new street is to be constructed with magnificent buildings, and is to be called the Prachstrasse. The cost of the improvements is estimated at 50,000,000 marks.

THE opening ceremony at the new buildings added to the Hampstead Workhouse, at a cost of about 20,000*l.*, was performed on the 22nd inst. by Mr. B. A. Lyon, chairman of the Guardians. The addition provides a new dining-hall, dormitories and day-rooms for aged and young women, night and day nurseries for children, and other offices, there being altogether total accommodation for 153 additional inmates.

NEW buildings have been added to the Wakefield Workhouse, which will be opened on January 19, and comprise a new infirmary and a steam laundry. These additions were designed by Mr. Wm. Watson, of Wakefield. The infirmary will accommodate 150 patients, with the requisite staff. The buildings, which are in the rear of the workhouse, consist of a central administrative block, with waiting-rooms and a surgeon's room on the right, with the kitchens and pantries behind. The men's pavilion is on the left, at a distance of 42 feet from the central block, with which it is connected by a covered corridor. The women's pavilion is on the right. Substantial brick walls have been built to entirely surround the workhouse premises. The laundry block is near the eastern boundary of the site, and is 45 feet by 200 feet.

THE old parish church of Eckford, situated on the banks of the Teviot, near Kalemouth, which has been closed since May last in order to allow of extensive internal alteration and improvement, was reopened for public worship on the 18th inst. The scheme of restoration embraced the entire reseating of the church, the removal of the east gallery and the forming of a chancel at that end, the insertion of a new Romanesque window in the east gable, the introduction of a modern system of heating, a new pulpit and communion-table. The alterations proceeded upon plans furnished by Messrs. Sidney, Mitchell & Wilson, architects, Edinburgh, and the various branches of the work have been satisfactorily carried out by local tradesmen at a cost of about 600*l.*

ON Wednesday of last week the parish church of Mertoun, near St. Boswells, which has been for some time closed for

MARION & CO., 22 & 23 SOHO SQUARE, LONDON, W.

extension and improvement, was reopened for service. The church, which is cruciform in shape, has been entirely reseated, while the north wing has been extended to make up for the accommodation lost by the removal of the galleries. A handsome new pulpit, in Decorated Gothic style, has been put up, and a large rose-window has been inserted in the belfry gable. The work of renovation has been carried out by local tradesmen to plans by Messrs. Hardy & Wight, Edinburgh.

AT a meeting of the Wolverhampton Guardians the Board had under consideration the report of the new workhouse committee, and the chairman proposed that the amended plans for the new workhouse be adopted and sent to the Local Government Board for approval. He congratulated the committee on having effected a saving in the estimates of 12,003*l.* Mr. Sankey seconded. On the motion of Mr. Sawyers, however, it was decided that a day be appointed for the inspection of the plans in the Board-room, and that the architect (Mr. Marshall, of Nottingham) be asked to attend and give any explanation of them that may be required.

THE new parish church at Morven was opened on the 18th inst. by Dr. Norman Macleod. It has been erected from designs by Mr. P. Macgregor Chalmers, of Glasgow, and has cost upwards of 1,000*l.* It has been erected on the site of the old one, close to the ruins of the Mediæval church and the tall and beautifully sculptured cross. In taking down the old church a large fragment of a cross shaft was discovered, as well as other parts of moulded and enriched stones, which belonged to the ancient foundation, and which proved it to have been of rich and elaborate design. These have been carefully preserved. The style of the new church is Norman. It is built of whinstone, rough-cast on the exterior, with all the corners, windows and doors and all interior stonework of red freestone. The design comprises a chancel for the oak communion-table and elders' seats, and a nave seated to hold about 200 persons. The vestry opens off the side of the chancel. The roofs throughout are all of open timber. The church has been richly and comfortably furnished.

MR. J. SCOTT FRASER, F.R.G.S., delivered last week a lecture in the Fairfield Hall, Beech Street, Liverpool, on the subject of "Life in Old Rome during the Augustan Period." The Rev. Mr. Fyffe presided, and there was a large audience. In the course of the lecture, which was a vivid description of life in Imperial times, illustrated by views of the city restored, Mr. Scott Fraser exhibited a photograph of the interior of St. George's Hall, Liverpool, with the wooden flooring removed, which he mentioned was designed after the central Bath of Caracalla, Rome, but only one-quarter the size. This view showed the original pavement, the sides being raised some 18 inches or 2 feet above the central part of the hall, forming a platform round it. The central part of the floor much resembles a bath some 2 feet deep, executed in examples of ornamental tiles, figures of sea-nymphs and dolphins inlaid in brilliant colours. Harvey Lonsdale Elmes, the talented architect, was only twenty-four years of age when his design was accepted by the Liverpool Council. The anxiety and enormous responsibility which this stupendous work demanded of him was more than he could sustain, his health completely broke down, and he died in the island of Jamaica before the building was completed. St. George's Hall stands to-day a magnificent monument of his genius, described by Mr. Shaw Lefevre as "the finest example of Classical architecture of modern times in Europe;" but it was, the lecturer said, a great reflection on the generous character of Liverpool citizens that the work of this talented young man should not have received public recognition in some form or other, such as by the erection of a statue, or even by a medallion or tablet, to him in the building itself; in fact, he believed that his name is not even engraven on any part of it. Mr. Scott Fraser concluded his reference to this with a strong appeal that some effort would yet be made to suitably recognise the magnificent work of Elmes.

EVEN under the most favourable circumstances the work of an expert chimney climber is very hazardous, and requires great care and strong nerves. Several years ago it was considered a marvellous accomplishment, says the *Liverpool Courier*, for the Vauxhall chimney to have been ascended in a period of about six hours, the height being 312 feet. The ladder system then used by Mr. W. J. Whitehead, whose work in this direction has made him somewhat famous throughout Lancashire, was the most perfect available. The ladder was constructed so that the ascent might be made from the inner space between the ladder and the wall, and each section was arranged at regular intervals of 6 feet by firm iron brackets. It was made in sections, and blocks of wood and ropes were necessary in affixing it to the chimney so as to give security to the climber. That, perfect in its time, has, however, become a thing of the past. A new system has been invented which was put into operation this week at the sugar refineries of Messrs. Crossfield & Barrow, in Vauxhall Road. The chimney in this case is about 200 feet in height, and it was necessary for the protection of the stack and surrounding buildings for the

lightning conductor to be repaired. To do this an ascent was essential, and Mr. W. J. Whitehead was entrusted with the task. Quite a sensation was caused while the ascent was in progress, and the ease with which it was made caused considerable surprise to the hundreds of people watching the experiment. The new ladder is a very ingenious one. It is affixed within a few inches of the brickwork to the chimney, and the worker proceeds by longer sections, two holdfasts being driven up a distance of about 30 feet, where four spikes were previously required for 10 feet. The ladder is of iron, and the sections are so securely fastened together that on its completion it is really a solid whole, and enables the ascent to be proceeded with at the minimum of danger and the maximum of speed. In 2½ hours the ascent was made, and although the height was 100 feet less than the celebrated Vauxhall chimney, the ascent occupied so short a time that it is considered to be a record feat on the part of the well-known steeplejack.

"WOODINE."

"Woodine" is the name given to a composition for making flexible moulds for casting Portland cement in high relief. Hitherto it has not been possible to make satisfactory castings owing to the rapid shrinkage which takes place in the usual mould made of gelatine, and also to the action of acids in the cement destroying the face of the moulds. With "Woodine," however, these objections do not arise, as the moulds made with this material remain unaltered for weeks. We have inspected some that have been in existence for three months, and the decrease was so slight as to be of very little consequence. From these moulds some dozens of casts have been made. It is hardly necessary to point out the many uses to which Portland cement cast in high relief may be adapted, both for the enrichment of the exterior and interior of buildings. We are informed that eight pilasters, each weighing 1½ cwt., and being 6 feet long with moulded base and carved capitals, have been made from one "Woodine" mould, and that if necessary four casts per day for a month could have been taken without spoiling the mould.

There can be no doubt that "Woodine" moulds are more durable, tougher and yet more flexible, and are in every way superior to those made of gelatine, and after use may be remelted several times. Further particulars may be obtained of Mr. John R. Wildman, 17 Albion Street, Leeds.

TRADE NOTES.

The firm of Horne, Son & Eversfield has been long familiar to builders and contractors and property-owners in the Metropolis. As Mr. Horne, senior, retired some years ago, Mr. W. Edgar Horne, the head of the firm, has altered the title to "Horne & Co." He has also taken into partnership Mr. William Vincent Jull and Mr. John Roy Lancaster, who have for several years assisted him in the conduct of business. The offices will remain at 85 Gresham Street, City, and 19 Great George Street, Westminster. We wish the renowned firm under its new title a continuance of the success gained by experience, technical knowledge and devotion to clients' interests.

Messrs. Chatwood's Patent Safe and Lock Company, Limited, have received a letter *re* the recent massacres in Crete, of which the following is a translation :—

10 Rue de la Métropole 10 Athènes :
Chatwood, Esq. December 17, 1898.

Sir,—During the massacres and pillage in Candia, while all the other safes have been destroyed, only two safes escaped destruction and those have been manufactured by your firm. The safes belonged to two merchants and contained considerable sums of money. The Basizibuzuks having made desperate attempts, did not succeed to open them. One of the above-mentioned safes has been brought to the Piræus, and one might see on it the marks made with the implements of the pillagers. This fact has caused general astonishment. I have also had the opportunity of seeing the safe. Being myself an editor and a Cretan, I have thought it my duty to announce this important fact, which is a real triumph to your honourable firm, and congratulate you. I beg to enclose a copy of the paper of which I am one of the editors.—Yours faithfully, Signed, John Condilakis, Editor.

BUILDING AND BUILDERS.

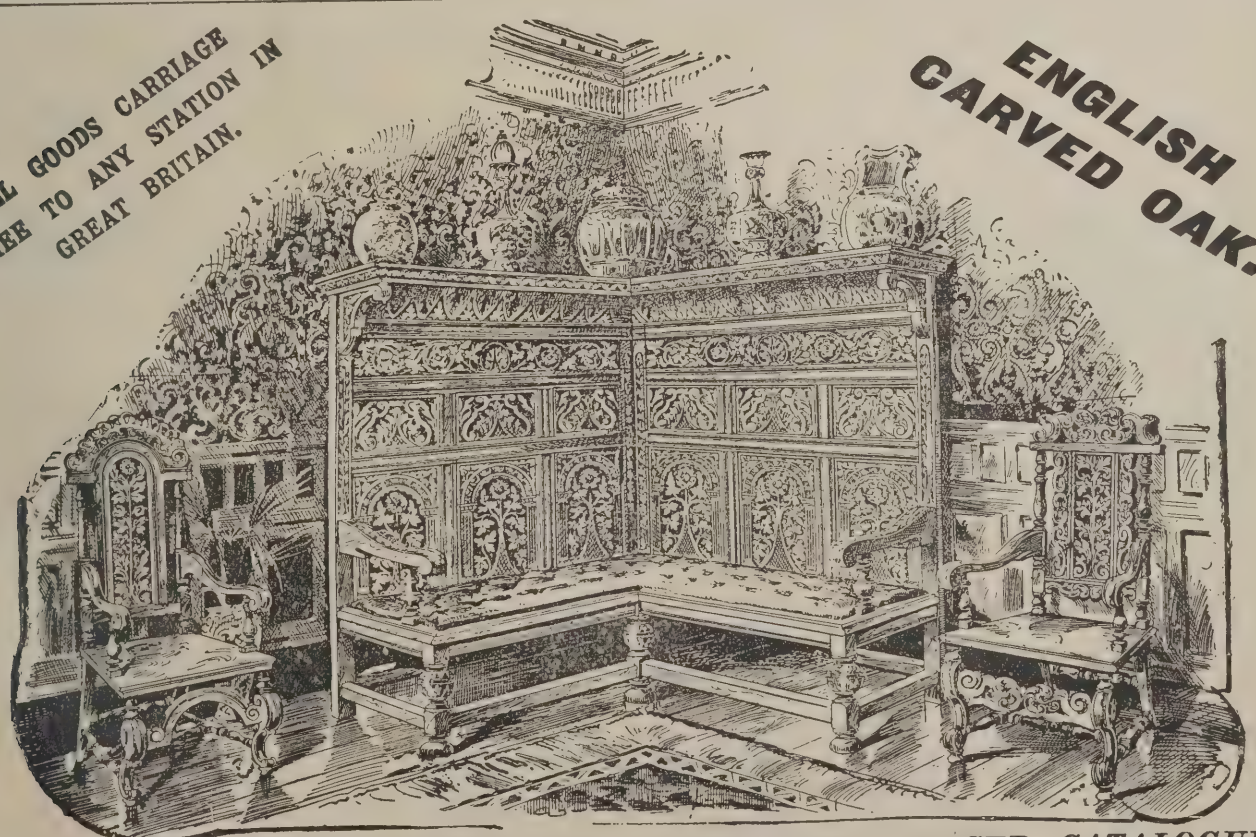
THE chapel which has been erected in the grounds of the Salisbury Union Workhouse for the use of the inmates having been completed, was dedicated to St. Thomas the Apostle by the Bishop of Salisbury on the 21st inst. The style of architecture is Gothic. The sitting accommodation is for 150 persons. The seats are of pitch pine, and comfortably constructed and arranged. Dr. Bourne very kindly gave the altar and retable, the material for the latter being cut from a piece of oak 700 years old, and brought from Stockton.

RICHARD STOCKTON, aged thirty-two years, residing at 22 Salisbury Street, Great Lever, and employed as a bricklayer by Messrs. Gornall & Sons, contractors, fell from a scaffold at Burnden Bleachworks on Tuesday, and sustained severe injuries to the head. He was removed to the infirmary in a critical condition, and died there on Wednesday.

JOHN MAXWELL, builder, 18 Canniesburn Road, Glasgow, was fined 10*s.* 6*d.*, with the alternative of seven days' imprisonment, in Glasgow Maryhill Police Court, for having, on December 14, caused a quantity of building material to be laid down in Cumloden Drive, Glasgow, not under the powers of any local Act of Parliament, or by the authority of the Dean of Guild, or by the written consent of the master of works. Bailie Fife, who tried the case, complimented the police at the end of it upon the manner in which they were looking after the proper regulation of the street traffic.

THE completion of the restoration of Bourne Abbey Church is being undertaken with energy. Over the last section of the restoration, the chancel, 1,000*l.* was spent. The present effort is directed to the restoration of the roof of the south aisle and the south porch. The abbey church is historically interesting as the abbey of Augustinian canons. Robert de Brunne, the "Patriarch of English Grammar," who lived here from 1307 to 1349, was one of the canons.

DR. G. D. THOMAS held an inquest at the Islington Coroner's Court on Tuesday with reference to the death of Henry Goulding, fifty-one, a scaffolder, lately residing at 140 Bayham Street, Camden Town. The deceased was in the employ of Messrs. G. Longden & Co., of London and Sheffield, building contractors, who are now erecting the Empire Theatre of Varieties in the Holloway Road. A workman's scaffold over 40 feet high, standing in the centre of the interior of the building, was, Mr. Webber (the clerk of the works) said, properly built. On Saturday morning last it became necessary to fix a "jenny wheel" to a jib projecting from one of the cross beams at the top of the scaffold, so that bags of cement might be raised by means of the rope passing over the wheel. The deceased volunteered to fix the "jenny" and proceeded to do so, while a labourer named Jeffreys stood on a platform beneath to receive the rope as it fell, and lower it to the bottom. The latter said he did pull the rope to the bottom, and then he saw the deceased as he passed him in his fall. At first the conjecture was that Goulding fell whilst standing upon the broad gangway of the scaffold trying to adjust the rope, and because, in reaching too far forward, he overbalanced himself. The coroner and jury, however, viewed the premises, and found that a narrow plank had been rested on the horizontal bar and the jib, and that it was while the deceased was standing upon this plank and adjusting or fixing the "jenny" that he somehow fell to the ground, after first striking a girder. The injured man was removed to the Great Northern Central Hospital, where he died a few hours after. The jurors further found that the wheel had not been tied. In the result the jury returned a verdict of accidental death, adding that the plank on which the deceased stood was insufficient for the purpose he was trying to execute.



ELECTRIC NOTES.

THE Birmingham City Council having acquired the powers of the Electric Supply Corporation have decided to introduce the electric light into the council house. The entire building will be so lighted, the cost of the work for which will be, it is anticipated, nearly 2,000*l.* The installation will be carried out with all the economy consistent with proper efficiency; and, so far as possible, the present fittings and pendants, many of which are very handsome and valuable, will be utilised for the new lights.

THE shareholders in the Sheffield Electric Light and Power undertaking met last week to complete arrangements for handing over the concern to the Corporation. Under the special

Act of Parliament the Corporation undertook to buy up the company on the basis of 220*l.* of 2½ per cent. redeemable stock for every 100*l.* of capital properly expended by the company, or as an alternative 213*l.* 8*s.* in cash for each 100*l.* The chairman of the company (Alderman Franklin) explained that as municipal securities had been deteriorating in the markets the directors had no difficulty in deciding to take the purchase price in cash, and it would be paid on the 31st inst. He estimated that for every 7*l.* share the holders will receive from 17*l.* 10*s.* to 18*l.*, in addition to a 10 per cent. dividend on the year.

PLUMBERS' REGISTRATION BILL.

A DEPUTATION of those interested in the promotion of the Parliamentary Bill for the Registration of Plumbers waited on the Secretary for Scotland, Lord Balfour of Burleigh, at his chambers in Parliament Square, Edinburgh, on Tuesday last, for the purpose of representing to him the desirableness of making the Bill a Government measure.

Ex-Bailie Crawford briefly explained the objects of the movement and the necessity felt for legislative sanction for it. The movement had now been in existence for fifteen years, and a Bill had been read a second time by three successive Parliaments, and had twice passed through committees of the House of Commons. The Bill did not seek in any way to create a monopoly. Its aim was solely to establish a thoroughly representative general council, which would have certain discretionary powers, and the Bill would also prohibit under a penalty the use by any one of the term "registered" who was not registered under the Act.

Lord Burleigh, in reply, expressed his sense of the importance of the deputation, which he observed was fairly representative of Scotland. He also gave expression to his complete sympathy with the movement for introducing a higher standard of qualification and a higher code of honour among those to whom the responsible work of the plumbering and the drainage of dwelling-houses was entrusted. He was satisfied that the movement did not aim at any monopoly. While he was not in a position to commit the Government at that stage, he would undertake to report immediately on his return to London in the beginning of the year the representations which had been submitted to him, and to confer with the representatives of the Local Government Board for England as to possible assistance towards securing the passage of the Bill into law.

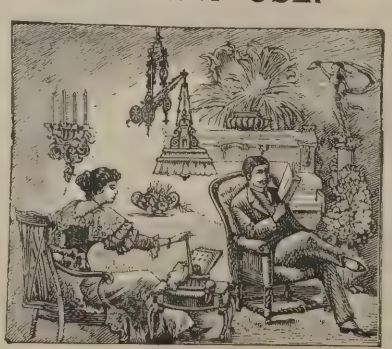
On the motion of Mr. James Hyslop, Dumfries, a cordial vote of thanks was given to Lord Balfour for his reception of the deputation.

SHERNBOURNE CHURCH RESTORATION.

ON Saturday afternoon the Prince and Princess of Wales, the Duke and Duchess of York, Princess Victoria of Wales, Prince Alexander of Teck, Sir Dighton and Lady Probyn, Sir Francis and Lady Knollys, Miss Knollys and Commander the Hon. Seymour Fortescue attended the reopening service of Shernbourne Church, Norfolk, situate on the Sandringham estate. Amongst the clergy present were the Dean of Norwich, the Rev. Canon Hervey (rector of Sandringham), the Rev. Percy de Putron (curate), Rev. H. J. Hare, of Docking (rural dean), Rev. F. J. W. Girling (vicar of Shernbourne), Rev. F. A. S. Ffoulkes (rector of Wolferton), Rev. David Jones (rector of Anmer) and the Rev. J. C. Girling (rector of Coltishall).

Shernbourne Church (dedicated to SS. Peter and Paul), and stated to have been the second founded in East Anglia by St. Felix the Burgundian (that of Babingley, now in ruins, claiming the premier honour), has for upwards of two years been closed for restoration, which has been effected at a cost of about 2,000*l.* Up to the time of this much-needed restoration being taken in hand the church consisted only of a small and insignificant nave, and for many years past presented every evidence of decay and ruin. It has, however, principally owing to the munificence of H.R.H. the Prince of Wales, who recently became the purchaser of a large portion of the parish (which adjoins Sandringham), undergone such an external and internal transformation as to compare favourably with any village church of similar size throughout the country, being the latest instance of the care and attention which the Heir-Apparent has always shown in the churches attached to his estates.

During the restoration of the old walls, and in the process of excavations being made, the foundations of the original aisle and chancel were discovered, and these indications have inspired the lines on which the work has been conducted, the church now consisting of nave, chancel, south aisle and porch, and the fabric at the close of the nineteenth century must now be very similar to its appearance in the fourteenth.



The work has been executed gradually and carefully, as it well deserved, as no Mediæval work that could possibly be

CORK PAVEMENT is NON-SLIPPERY, NON-ABSORBENT, NOISELESS.
Proved by over six years' experience under heavy road-traffic to be more durable than wood.
Recommended by the highest Authorities as the Best and most Sanitary Pavement for **Streets, Stables, Kennels, Yards, Bas ements, Church Aisles, &c.**, whether for outdoor work or under cover. Can be seen in London and the provinces in all above uses, Gold, Silver and Bronze Medals awarded, Brussels International Exhibition, 1897, for Hygienic Street and Stable Pavement. Highest Award at the Agricultural Hall for Kennel Paving, 1897 and 1898. Samples, Prices, and all particulars of THE IMPROVED CORK PAVEMENT CO., LIMITED, 21 ST. MARY AXE, LONDON, E.C.

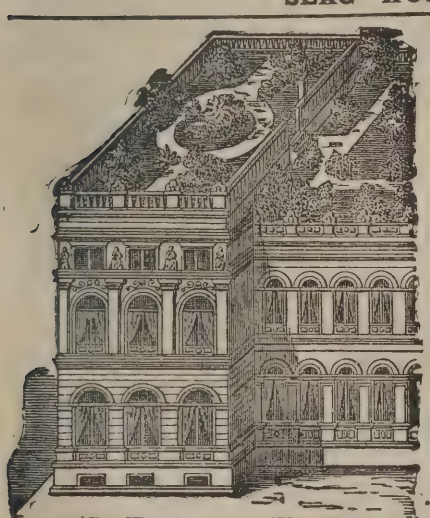
retained (and several remains were recovered) has been hidden from view. Although the walls have been partially rebuilt, such judicious use has been made of the old material (flint and rubble) as to redeem them from the appearance of raw newness almost inseparable from such work, while the retention of the ancient stonework in doorways, windows and arcading considerably enhances the appearance of age.

Externally the roofs of nave and chancel are covered with Broseley tiles, a stone cross surmounting the east gable, and a bell turret the western. The roofs to south aisle and porch are covered with lead. An addition has been made to the churchyard, and all enclosed by a flint and carr stone wall, with an oak entrance gate, while the churchyard itself, formerly a scene of desolation, has been levelled, turfed and the memorial-stones regulated.

Internally the change is no less marked, the chancel having a waggon-headed roof in oak, treated with moulded ribs and carved bosses, those to nave and south aisle being of a plainer character, but equally effective. The piers to the south arcade (of the Decorated period), after being walled in for centuries, again divide the nave from the south aisle, the eastern end of which is intended for the future organ chamber, an ancient doorway giving access to the chancel. The floors of nave and aisle are of wood blocks, the sacrarium and chancel being laid with tiles and stone steps. The pulpit (on stone base) and the choir stalls are in oak, of appropriate design, and the font (reputed the oldest in England) has been refixed on a stone slab. The only remaining brass, together with the Purbeck marble slab to which it is attached, have been restored and refixed in an upright position in the north wall of chancel. This probably commemorates Sir Thomas and Lady de Sharnborne, who Blomefield in his "History of Norfolk" states were buried beneath the high altar in the ancient chancel.

All the memorial mural tablets have been retained. The windows throughout are glazed with cathedral glass. The contractors entrusted with the execution of the work have been Mr. Geo. Riches, of Dersingham, who restored the fabric of the building; Mr. John Boddy, of Harpley, being responsible for the roofs, floors and internal fittings; and Mr. A. W. Hall, of Norwich, who restored and reinstated the ancient stonework, together with the new masonry throughout.



Sir Arthur Blomfield, of London, has acted as consulting architect, and the work has been carried out from the designs and under the superintendence of Mr. Herbert Green, of Norwich.

ELECTRIC LIGHT IN SALISBURY.

THE formal opening of the new electric-lighting station at Salisbury took place on the 19th inst., and was a function of considerable ceremony. The actual switching on was performed by the Earl of Pembroke, and the switch used was a copy of one lately made for the royal waiting-rooms at Windsor station, and has been made up as a paper weight, with a suitable inscription, for Lord Pembroke to retain as a memento of this interesting occasion. The works have throughout been designed by Messrs. Edmundson and carried out by them. Mr. L. A. Hards, who acted as their resident engineer, is now engineer to the Salisbury company. The site is the old Town Mill, about half an acre in extent, which was the property of the Dean and Chapter of the cathedral for seven centuries. At the east end is a new two-storeyed building, used as an office and show-room, with a store and workshop below. The next building is the old four-storey mill, having on the ground floor the eel-trap, tank and storm-water gate at one end, and further storage room at the other. On the first and second floors are the accumulators. The upper floors are empty. The engine-room is a new building containing the turbine, engine and dynamos. The boiler-house is at right angles to the engine-room, and the triangular-shaped room between is intended to hold the condensers when the loan on the steam plant warrants the cost of adding these. The whole of the engine and boiler-house are built of fireproof materials, the roof being iron, glass and tiles; the walls are built for the most part of flints set in cement.

A siding of the L. and S. W. R. adjoins the company's property. Some day no doubt this will be of great value, but for the present, as the consumption of coal will be small, it will be carted to the works. Mr. E. Doran Webb is the architect. The builder of the works was Mr. E. Hale, of Salisbury, and of the chimney Mr. J. Thompson, of Peterborough. The chimney is octagonal, 100 feet high and 6 feet diameter inside. There are at present in place a 60 horse-power vortex turbine and dynamo, one Babcock and Wilcox boiler of 1,218 heating surface, two Worthington feed pumps, one of Joseph Wright's Excelsior feed heaters, and a Bellis Parker set of 84 kilowatt output, 180 ampere and 460 volts. Space has been left and all provision made for adding another boiler and engine set when required. The steam pipes are on the usual ring main principle, and the feed pipes, &c., in duplicate. A galvanised iron tank capable of holding 2,000 gallons is supported by

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

an arch high up in the boiler-house, to give supply by gravitation to the feed heater. The supply in Salisbury is at present being given from the turbine which has been made by Messrs. Gilkes, of Kendal, with revolving wheel 8 feet 6 inches diameter, and is capable of giving 60 horse-power with 5,883 cubic feet per minute working under a 7-feet head. It runs at 28 revolutions per minute, and drives the dynamo at 850 revolutions by gearing and belting. The turbine is fitted with movable guide blades for adapting the entrance orifices to any quantity of water below the full supply. These are fitted with gearing for adjusting them. The hand wheel for this purpose is placed in the centre of the switchboard. As the plates of the turbine are very massive, it is quite hard work to close them, and an electric motor is to be fixed to give the switchboard attendant a quicker and easier control. The dynamo driven by this turbine is composed of two machines coupled together, each capable of giving an output of 100 amperes at 230 volts, one machine being connected each side of the three-wire system. On the ends of the dynamos are coupled the boosters, to add the extra pressure for charging the accumulators. The armatures of the boosters are wound on a slieve and slipped on to the end of the spindles of the dynamos. In the event of the turbine being out of use this machine can be used as an an ordinary balancer booster combination by the removal of the belt. The switchboard was made by Thos. Parker, Limited, to Messrs. Edmundson's designs. It is divided into three parts. On the left hand are the switches, ammeters, auto-cut-outs, &c., for the combination dynamo and booster, also the battery regulating switches and ammeters, the throw-over switches, zero indicators, &c. On the right-hand panel are the feeder, ammeters and duplex cut-outs, the dynamo ammeters, auto-cut-outs, fuses, &c. The centre panel carries the recording volt-meters, recording ammeter on the earth connection to the neutral wire and cut-outs, switches, &c., for testing the insulation of the main. Through the centre of this panel projects the spindle of the gear for opening and closing the blades of the turbine, and an indicator is fixed showing the position of the blades and also the level of the top and bottom water, so that at a glance the attendant can see the position of affairs. Two Kelvin large dial volt-meters, one on each side of the system, are fitted on the side wall, so that they can be seen when standing in front of the switchboard, or any part of the engine-room. The pressure of the consumers' lamps is 210 volts. Thomson-Houston meters are fitted on the output of the dynamos and on the battery circuits; these latter read forwards when charging and backwards when discharging, and therefore give the energy lost in the cells. There are 230 accumulators, D.P. type, 715 ampere-hour capacity, 80 ampere at 420 volts for 9 hours or 119 ampere for 4 hours. At present the turbine runs for about 18 hours daily, in the morning for charging and in the evening with the cells to supply the light required. The water-power varies very considerably, but even in the driest weather of last autumn there was always about 15 horse-power available, the average amount is 25 to 30 horse-power, and when the river is flowing full 50 to 60 horse-power. With the aid of a large battery this power is sufficient for a large percentage of the demand in a town of the size of Salisbury, and is of great advantage as regards the cost of supply. The mains are of Messrs. Callender's jute insulated lead-covered and armoured type, the feeders being concentric and the distributors 3-core. The lengths are:—Feeder No. 1, 117 yards; feeder No. 2, 711 yards; sub-feeder, 567 yards; distributor, 892 yards, .100, 584 yards, .075, 5,285 yards, .05. Already considerable extensions of the mains have been laid owing to the demand for light in the residential district of the city.

WORKS AT WILLESDEN.

THE reports of Mr. O. Claude Robson, the engineer to the Willesden District Council, should be filed in all libraries to which students of municipal engineering have access, for they will be found to be encyclopædic in character. Although primarily intended for the information of the ratepayers, yet care is taken to introduce any information which comes under Mr. Robson's notice, and is likely to be of use to borough engineers and surveyors.

For instance, when recording the reduction of the number of years in which loans for wood-paving must be repaid, viz. five instead of ten years for ordinary Baltic fir blocks, whether plain or creosoted, and ten instead of twelve years for Australian hard wood, thus considerably affecting the annual expenditure by local authorities for this description of work. Mr. Robson adds :—"The comparative merits of hard and soft wood paving have, I think, yet to receive more detailed consideration than has yet been possible by experience of their respective wear. In our own district we have certainly not had sufficient time to arrive at a satisfactory conclusion

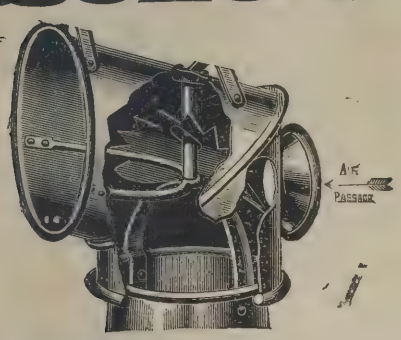
P. A. GILBERT WOOD,
PUBLISHER, STRAND, LONDON, W.C.

as to the most desirable timber to adopt. Outside the question of durability, however, there are other matters to be considered relating to comfort, amount of expansion and contraction, antiseptic qualities, &c. It is also possible that one description of wood may be adaptable for one locality that would not be so desirable in another. Thus where quietude is not an absolute necessity and where durability is the primary question, as would be the case in crowded business centres, it is likely that the hard wood would be adopted, as doubtless its life is longer and less interference with the busy traffic of the locality would take place by its longer period of existence. In more residential localities, on the contrary, the creosoted timber may be preferred as a more noiseless material, although its life is shorter."



It suggests the care taken in all departments when we find it stated that in the watering of wood-paved roads a small amount of antiseptic fluid has been introduced into each van load of water. In a roadway thus paved, with any amount of traffic thereon, it is an absolute necessity in addition to the careful cleansing of the surface that some disinfecting medium should be used, otherwise most sickening odours arise that are not only unpleasant, but it has been stated by some medical experts that throat trouble may arise therefrom. Especial attention has therefore been paid to this question when hot weather prevails.

The part of the report relating to buildings is interesting. The Brent district appears to be sought after for houses of a rental value of 40*l.* a year and under, while the better-class houses are generally erected in the metropolitan district. It was found necessary to serve 280 notices for contravention of by-laws, but in the preceding year the number was 486. The difficulty of supervision is described as follows :—

The by-laws involving the largest number of notices were those relating to brickwork, the erection of buildings of combustible material, and for failing to give notice as to commencement and completion of buildings. In the matter of brickwork every endeavour is made to insure good materials and sound work. It must however be remembered that each inspector has possibly 100 to 200 houses for supervision, that they are scattered about in various localities, and office work has also to be performed. The prevailing use of the mortar mill is also an unfortunate element where other material than sand is sanctioned for use. To efficiently supervise the composition of mortar for every building would necessitate the constant attendance of one man upon every block of buildings, which it may be readily understood is impossible, yet there are those who consider that the same amount of supervision should be accorded by the public authorities as that given by the clerk of works upon a special building for which he and the architect are specially paid. This detailed supervision could only be carried out by the public being willing thus to place and pay for a separate inspector continually attendant upon each building in the district, the cost of which would of course be quite beyond reason. The work of supervision by the inspectors in the employ of the Council is, so far as time and facilities extend, excellently carried out, every endeavour being made to secure sound work in the carcases of the buildings. Were it possible to specify sand and lime only as the material for mortar purposes, great assistance would be rendered in the supervision and less likelihood would occur of inferior materials being used, as there would be no excuse for the existence of any other aggregates than sand being upon the work. In this respect the work of the special clerk of works is facilitated, as probably sand only is thus specified, whilst with the inspectors brick rubbish, clinker, or other similar material is sanctioned, involving some controversy as to the suitable character of such varied material. Thus the duties of the inspector are much more arduous than the question of supervision of brickwork, both as to extent of building operations and the discretion to be used in sanction of material, than are the duties of the clerk of works constantly upon a building forming the subject of a contract, and it is consequently most unreasonable to expect the same result from public supervision of buildings as that accorded to a contract with special and constant supervision from the architect and his clerk of works. I have, perhaps, dealt with this matter at undue length, but I have upon so many occasions received complaints as to alleged "neglect" in supervision of brickwork, especially by reason of the use of brick rubbish in mill mortar, that I am desirous of recording in these pages the absolute unreasonableness of such complaints, as brick rubbish of proper quality is sanctioned under the by-laws, and as the inspector is not ubiquitous he cannot be standing over every mill or batch of mortar to insure every particle mixed being of proper quality. The public supervision can be but intermittent, and if at any time during supervision inferior material is discovered action is taken to remove the work which is built with this material, as is evidenced by the service of seventy-two notices and six summonses with regard thereto. In addition many verba

Soho Cowl & Ventilator

(NICKLIN & MILWARD'S PATENT).

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

cautions are given by the inspectors and attended to without necessity for the service of notice.

PROPOSED NEW MARKETS IN LONDON.

THE copy of a Bill which will be introduced into Parliament next session has been deposited for the purpose of incorporating a company with powers to establish markets at Millwall and Shoreditch. The Millwall market, which will adjoin the Millwall Dock, is intended to be "for the sale of cattle, horses, sheep, pigs, poultry and other live-stock imported from Ireland," whilst the market at Shoreditch is proposed to be confined to "the sale of British, Irish and colonial butchers' meat, fish, poultry, game, eggs, corn and other cereals, hay, straw, fodder, roots, fruit and vegetables and other produce." The capital which it is estimated will be required to carry out this scheme is 3,000,000*l.*, of which 600,000*l.* will be raised by mortgages on the markets.

METROPOLITAN IMPROVEMENTS.

THE London County Council at the end of last week deposited in the Private Bill Office their Improvements Bill for promotion in the ensuing session, for the construction of a new street and for several important street widenings in the County of London. The Bill includes provision for the formation of the new street from Holborn to the Strand, the widening of Southampton Row, the widening of High Street, Kensington, the reconstruction of the Cat-and-Mutton Bridge, Shoreditch, the widening of Wandsworth Road, Lambeth, and the reconstruction of the Old Gravel Lane Bridge. The net cost of all these improvements, without deducting contributions, is 1,154,700*l.*, and the estimated net cost to the Council, after deducting contributions but not betterment, is 1,105,700*l.* The annual charge on the rates for interest on and repayment of debt calculated on the net cost will be 49,145*l.*, equivalent to a rate of ·321*d.* in the pound, the annual charge of interest decreasing annually by 515*l.*

The most important of these improvements is the scheme for the formation of the new street from Holborn to the Strand, the proposal being much the same as that recommended by the improvements committee in 1892 and 1895. The scheme provides for the formation of a street from High Holborn at Little Queen Street, opposite Southampton Row, proceeding in a southerly direction intersecting Great Queen Street, Sardinia Street, Vere Street and Stanhope Street. To this point it is practically the same as that proposed on former occasions, but at Stanhope Street, instead of continuing in a direct line to the Strand, the street bifurcates.

The western branch, of the same width as the main street, 100 feet, passes in a south-westerly direction, crossing Drury Lane and entering Catherine Street and the Strand close to Wellington Street, so as to form an approach to Waterloo Bridge. The eastern branch, also of the same width as the main street, passes from Stanhope Street through New Inn to the Strand at St. Clement's Danes Church. The scheme also provides for the widening of the Strand for a considerable distance on the north side of St. Mary's Church, and for the acquisition of the whole of the site within the area bounded by the Strand and the two branch streets.

It is not intended to ask for the removal of the church of St. Mary-le-Strand. The Institute of British Architects has pointed out that an objection to the scheme submitted to the Council in 1896 was that this church would not form a good architectural termination to the main street, as the church was designed for effect when seen from the west, and it was alleged that the plan of the spire being an oblong its appearance from the north would be thin and unsatisfactory. The scheme now proposed, however, will provide a handsome architectural termination to the new avenue, for the whole of the triangular space (nearly 4 acres) between the Strand and the two branch streets will form one of the most central positions in London, and it is claimed that the architectural effect of the buildings which will be erected on the site, when regarded in concert with the Law Courts, the flanking garden and the two churches (Holywell Street, of course, being demolished), will constitute one of the finest street views in London. The formation of the new thoroughfare and the subsidiary streets proposed will displace about 3,030 persons of the labouring class, and in the Bill adequate means are provided for rehousing. The gross cost of the necessary property is estimated at 4,442,000*l.*, and the recoupment at no less a sum than 4,088,300*l.*, leaving the net cost of 354,200*l.* The estimated net cost for works is 120,000*l.*, and for rehousing persons displaced 300,000*l.*, making the total estimated net cost of the scheme 774,200*l.*, which estimate may be somewhat reduced by the receipts from levying an "improvement charge," which it is contemplated to apply to certain portions of the scheme. The net cost of the scheme will involve a charge on the rates of ·226*d.* for the first

year. This will diminish gradually, but it is not anticipated that the first charge on the rates will accrue until three or four years hence.

Powers for the improvement cannot be obtained until July 1899, after which about two years will probably be occupied in the making of the initial valuation for the improvement charge, the formulation of a scheme for rehousing the displaced persons of the labouring classes, and the receipt of claims consequent upon the service of notices to treat. For the first few years from the commencement of the improvement the capital expenditure will be very large, and as a considerable proportion—indeed, nearly the whole—will in time come back in the shape of recoupment from the disposal of building leases for the large area to be cleared, application has been made for a suspension of the sinking fund, and the Treasury has consented that, in view of the temporary nature of the capital expenditure, payments to the sinking funds shall be suspended for a period of seven years. This is a large concession, and will effect a considerable saving. It is understood to be the first occasion on which such power has been granted in connection with an improvement Bill. The widening of Southampton Row is almost a necessary corollary to the formation of the new street. It is to be carried out on the eastern side, commencing at Vernon Place and Theobald's Road, and terminating at Holborn, exactly opposite the northern end of the proposed new street. There is also to be a widening of Holborn on the northern side, commencing at the southern end of Southampton Row and to extend some 50 yards eastward from the centre of that thoroughfare. The estimated net cost of the Southampton Row widening is 162,000*l.* The total net cost of the street improvements which are contemplated in this district, and which will be carried to completion on Parliamentary sanction being given for the new Holborn to the Strand thoroughfare, will be 1,721,000*l.*, made up as follows:—Strand widening at Holywell Street, 569,000*l.*; clearance of insanitary district at Clare Market and Drury Lane, 216,000*l.*; Southampton Row widening, 162,000*l.*, and the proposed new street from Holborn to the Strand, 774,000*l.* This, compared with 2,246,000*l.*, the estimate of 1892 for the same general scheme, shows a difference of 525,000*l.*

The proposed widening of High Street, Kensington, power for which is sought under the Improvements Bill, is to be executed on the northern side of the thoroughfare, the total net cost of the scheme being 81,000*l.*, towards which, it is anticipated, contributions will be received from the local vestries. The proposed widening of Wandsworth Road is to be executed between Vauxhall Cross and Nine Elms Lane. The estimated net cost of this improvement is 55,000*l.*, and no contributions will be asked from the local authorities, it being considered that the widening of the road is needed, not by local traffic, but by general through traffic to and from all parts of London. In connection with this improvement the Council are asking Parliament to exempt them from the operation of section 92 of the Lands Clauses Consolidation Act, 1845, which provides that where the promoters of a public undertaking, acting under statute, require to take a part of a house, building or manufactory the owner shall have the right of calling upon them to take the whole. This exemption is asked for because the widening proposed will only necessitate the acquisition of the forecourts of a large number of houses on the route.

POOR-LAW BUILDINGS IN LONDON.

IN addition to the new block of buildings, costing 50,000*l.*, opened by the Marylebone Board this summer, the guardians are erecting another block in Marylebone Road, and several other boards are engaged in extensive building operations. The Islington Guardians are spending 250,000*l.* on a large infirmary at Highgate, capable of holding 800 patients. The Board has been charged with extravagance in spending so much money on this building. But the position of Islington is a peculiar one, showing as it does that the population of inner London is rapidly shifting outwards. Since 1880 the poor of Islington has increased at a fast rate, so that the infirmary accommodation has become utterly inadequate. The cause is not far to seek, for Shoreditch and Holborn are gradually becoming covered with warehouses, and the poor who formerly lived in those districts are being forced into Islington. The St. Olave's Guardians are leaving their riverside "house" and have acquired 35 acres of land at Ladywell, Lewisham, where new Poor-law "homes" are to be erected in blocks at a cost of 195,000*l.* Cottage homes are to be provided for the children who are to be removed from the Sutton barrack school, and new union offices have been erected in Tooley Street. Altogether for these works a sum of about 268,000*l.* is required. The St. Saviour's Guardians and the St. George's Board are also contemplating the building of new workhouses, and the Camberwell Guardians are proceeding at once to erect additional infirmary buildings, while other boards have expen-

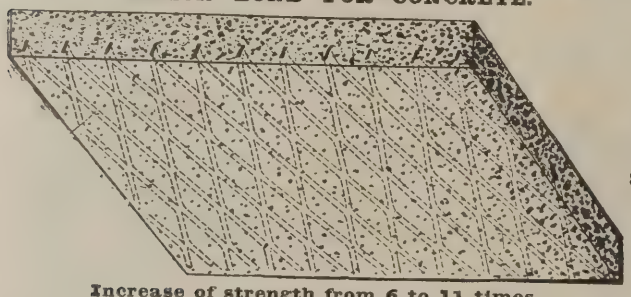
sive works in hand. These huge buildings involve a severe tax upon the ratepayers of the districts concerned, and there is a considerable feeling in favour of a further equalisation of rates throughout London with regard to workhouse buildings. The poor are gravitating in large numbers to certain districts, as in the case of Islington, causing an unduly large burden of expense to fall upon those districts, and the difficulties thus caused by the shifting of the population are being brought to the front with the view of obtaining relief from the Common Poor Fund to which the richer districts contribute.



BOLTON MASTER BUILDERS' ASSOCIATION.

The annual dinner in connection with the Bolton Master Builders' Association was held at the Swan Hotel on the 15th inst. There were about seventy gentlemen present, and Mr. J. H. Marsden, president of the Association, occupied the chair, being supported by Alderman Tong, Councillor Maginnis, Councillor J. Higson, Mr. John Dickinson, Mr. James Roocroft, Mr. Jos. R. Vose (secretary to the Association), and leading members of the local building trades. The usual loyal and patriotic toasts were submitted from the chair, appropriate reference being made to what the Army had accomplished recently in the Soudan. Mr. Isaac Jones responded for the Army, Navy and Auxiliary Forces, and the proceedings concluded with the singing of the National Anthem. The musical arrangements were in charge of Mr. W. Townson. The vocalists included Mr. Stanley Jackson (whose amusing sketches were much appreciated by the assembled company), and a glee party composed of Messrs. F. Sandham, D. Warbrick, W. Townson and Vernon Bailey, with Mr. A. Entwistle as pianist.

THE NEW DOCK WORKS AT LEITH.

During the year good progress has been made in the construction of the various works for the enlargement of the harbour and docks at Leith. It will be remembered that the works were undertaken by the Commissioners to meet the requirements of the larger class of steamers which in these days are being constructed for the Transatlantic and Eastern trades, and some of which have now attained to gigantic proportions, carrying seven, eight, nine and even ten thousand tons of cargo in one journey. Vessels of this capacity, of course, require a greater depth of water than vessels of a smaller size, such as hitherto have frequented the port, and to meet this want the new dock is being constructed to a depth of 40 feet, which will give a depth of about 30 feet at high water of ordinary spring tides. The works necessitated the reclamation from the sea of upwards of 75 acres, which was accomplished a year or two ago. Since that time good progress has been made with the construction of the new dock itself, the walls of which are nearly all up to coping level, and nearly the whole of the excavation has been completed. At the present rate a few months will see the whole of the walls finished, and sufficient of the quays formed to enable sheds and cranes and other works to be proceeded with in the course of the ensuing year. A most important part of the work—the construction of the massive dock gates for the entrance lock—is now in hand. These gates have been constructed wholly of steel and fine iron, and each pair will weigh close upon 300 tons, and they will be moved by hydraulic machinery, the whole of which is now being made by the firm of Sir W. G. Armstrong & Co., Newcastle-on-Tyne. An important feature in connection with the new dock is the construction of a passage between it and the present Albert Dock. This work is now well advanced, the walls being up to fully half their height, and it is apparent that in the course of two or three months these walls will be completed and be ready for the dock gates being placed in the passage. When this work is done vessels of deep draught will be enabled to enter the Albert and Edinburgh docks through the new dock, which will be a matter of great convenience to all shippers by facilitating the entrance and working of the vessels. The east wall of the new dock is not at present being completed to its full extent. Arrangements have been made so that when desired the dock can be extended to nearly twice its present length at a very small expense, and the work can be carried out in a very short time. In view of the growth of trade which may take place, the importance of this cannot be over-estimated. The dock, as now being constructed, is 1,100 feet long and 550 feet wide, so that vessels can easily swing in it. Of late years the increasing size of the vessels and the advantages of being able to store imported goods in close proximity to the discharging berths, made it apparent that a greater width of quay than had hitherto been deemed necessary would be desirable, and this requirement has been fully kept in view in the laying out of the

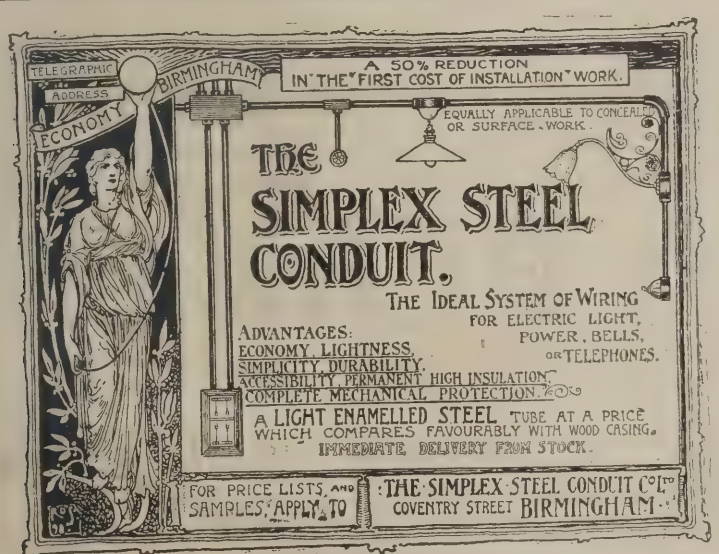
new dock, where the width of ground on either side of the dock is upwards of 400 feet, or almost exactly double the width of the quays on the sides of the Edinburgh Dock. An adjunct of the new dock, and which is placed at the south-west corner of the Edinburgh Dock, is a large new red-brick building with a high tower, in which additional hydraulic engines for working the coal cranes and machinery are now being placed. These engines will be of great power—double the power of those at present in use at the docks. An additional coal hoist has been ordered which will be one of the largest and strongest yet constructed, being capable of lifting waggons 20 tons to a height of 50 feet. The present coal hoist in the Edinburgh Dock has a lift of 33 feet. The construction of all this machinery, with the dock gates, has been a very heavy work, and has been undertaken to be entirely completed during the ensuing year, and it is expected that the new dock works, sheds, &c., will be finished and open for traffic within two years from the present time. At the last meeting of the Commissioners it was intimated that the new Leith lines of the Caledonian Railway Company from Bonnington to Seafield and the Edinburgh Dock would shortly be commenced, and that the railway would be completed by the time the new dock was opened. These lines will greatly increase the facilities for the conveyance of goods to and from all the docks.



NEW THEATRE, SHREWSBURY.

THE old and obsolete Theatre Royal, Shrewsbury, having undergone a very complete metamorphosis in accordance with the designs and under the superintendence of Mr. John P. Briggs, of Arundel Street, Strand, W.C., presented a brilliant appearance on the 12th inst. on the occasion of its inauguration. The building is constructed on modern principles, and the two tiers above the pit are supported by massive cantilevers, so that there is no obstruction to the view. The seating is well arranged, the stalls immediately behind the orchestra and pit at the rear having a good slope towards the stage. The dress circle consists of two private boxes and tip-up seats, upholstered in crimson velvet. The upper circle has divided seats upholstered in crimson moquette, and a spacious gallery with raised seats is also provided. The stage is large enough to accommodate the heaviest productions, and is fitted with approved appliances for scenic effects. There is ample dressing-room accommodation, all heated by hot water, and a plentiful supply of hot and cold water is laid on, thus securing the comfort of actresses and actors. The whole building is supplied with the electric light, and the front elevation, with the two bold arc lamps and the illuminated canopy with coloured glass, has a fine effect.

The principal entrance is approached from Shoplatch through a pair of carved mahogany doors. Its decorated ceiling, with paintings representing *Glory*, ornamental pay-office, mosaic floor and fernery containing palms and glow-lamps, make an attractive scene. The wide stone staircase with decorated ceiling and walls covered with Japanese paper, leads to the crush-room, and from this the ladies and gentlemen's cloak-rooms are reached; the refreshment-room is also here. A suite of rooms is provided for the management, and communication with all parts of the theatre is secured by speaking-tubes and electric bells. The upper circle is approached by a wide staircase, and in connection with this ladies and gentlemen's retiring-rooms and cloak-rooms are provided.

The pit is a large one, and is comfortably arranged with seats upholstered in crimson carriage cloth. The walls are covered with glazed porcelain tiles and filled in above with a warm-tinted wall-paper, and the ceiling is decorated with panels and scrolls. Ample retiring-rooms are provided for this important part of the house, and a spacious and well-fitted saloon bar has also been constructed. The gallery is approached from the road at the side of the theatre. A wide stone staircase leads directly to it, and the comfort of the occupants has been carefully studied. The stage has been made the most of, and adjoining it are the necessary property-rooms, &c. There is all the customary machinery for stage work, and the grid is at such a height that all scenes can be taken up without rolling. The stage is separated from the auditorium by a brick wall carried up through the roof, and the opening may be shut off with a steel and asbestos fire-resisting curtain.

The exits from all parts are good, and are so arranged that the auditorium can be cleared in the space of a very few minutes. All doors are made to open outwards, and are fitted with patent automatic panic bolts, no other locks or fastenings being necessary. A feature of the building is the handsome canopy which forms a shelter for the early arrivals, and also shields the carriage patrons from inclement weather. A novel means for advertising the week's play has also been introduced. The theatre is heated throughout by hot water on the low-pressure system, with American radiators. Hydrants and

fire appliances are provided on each floor, and the risk of fire is greatly minimised by the use of electric-light for illumination purposes. A supply of gas is installed in case of emergency. Special attention has been given to the ventilation of all parts of the house, which has been carried out on the Honeyman system.

DEVELOPMENT OF BARRY.

Everywhere in Barry building is going on rapidly; one of the largest new buildings, the offices of the Barry Dock and Railway Company, will be a palatial structure, worthy of being the headquarters of such a powerful and enterprising company. Schools, hospitals, hotels and public offices are either being arranged for or in course of construction; land has been laid out and houses built in all directions to meet the demand of those having work at the docks and in the neighbourhood. The country round is so pretty and healthy that the district is growing as a residential suburb. Many business men who have their work in Cardiff reside at Barry, and now that the Barry Railway Company has risen to the occasion and reduced the season tickets many more people are flocking to the neighbourhood, and there is great demand for good-class villa property in the better parts of the town. The district, fortunately, is administered by those who have the good of the neighbourhood at heart; they have been careful to see that good water is provided—the Council has been far-seeing enough to purchase and administer the gas and water services itself; parks and open spaces have been reserved, roads well laid out, drained and planted with trees, and good by-laws enforced to insure the new buildings being properly put up. Thus the district is a remarkably healthy one, a fact well attested to by the reports of the medical officer of health. From one portion in particular much is anticipated, for it is not only convenient to the town and has frontages to the new main Tynewydd Road, which gives access to the Holton Road, the principal business thoroughfare of Barry Dock, but has also frontages to the Barry Road, one of the principal high roads of the district, and the new road from Cadoxton will almost abut upon it. Beautiful views are obtained up and down the Channel and across to the Somersetshire coast, and although practically near to the town, yet the site is far enough away to escape the dust from the coal-tips and smoke from the engines, &c. Taking the past progress of the town as a guide, it naturally will only be a short time before this land is all buil upon. Messrs. J. P. Jones, Richards & Budgen, of 18 St. Mary Street, Cardiff, who are acting as the agents, announce that it is intended to charge a very moderate ground-rent and to keep the fees and charges unusually low so as to foster the erection of better-class property, which the position commands and the growing population requires.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

26216. Wilhelmina Houben, for "An improved manufacture of hard and elastic material for use in covering floors, walls, mouldings, &c."

26414. Alexander Mann, for "Improvements in and relating to the quarrying of granite, freestone and the like."

26415. William Oliphant, for "Improvements in and connected with apparatus for heating conservatories, houses or other buildings."

26441. Henry Procter and Henry Taylor, for "Improvements in inlaid ceramic art decoration."

26468. William Phillips Thompson, for "Improvements in or connected with the building or construction of houses or the like."

26532. John Barrett House, for "An improvement in a bricklayer's stock tool."

26661. John Pickford, for "Climax brick and tile for fixing tiles to the outside walls of dwelling-houses and other buildings."
